

Avalanche danger
updated on 18.2.2025, 17:00

region A

Moderate (2=)

Wind slab

Avalanche prone locations

Danger description

The wind slabs of the last few days are in some cases prone to triggering. The prevalence of these avalanche prone locations will increase with altitude. Avalanches can in some cases be released by people and reach medium size.
Backcountry touring calls for careful route selection.

Moderate (2)

Gliding snow

In particular on steep sunny slopes individual gliding avalanches are possible below approximately 2400 m. These can in some cases reach large size. Caution is to be exercised in areas with glide cracks.
As a consequence of warming during the day and solar radiation moist loose snow avalanches are possible.

region B

Moderate (2=)

Wind slab

Avalanche prone locations

Danger description

The wind slabs of the last few days are in some cases prone to triggering. The prevalence of these avalanche prone locations will increase with altitude. Avalanches can additionally be released in near-surface layers in isolated cases. Avalanches can in some cases be released by a single winter sport participant and reach medium size. Backcountry touring calls for careful route selection.

Moderate (2)

Gliding snow

In particular on steep sunny slopes individual gliding avalanches are possible below approximately 2400 m. These can in some cases reach large size. Caution is to be exercised in areas with glide cracks. As a consequence of warming during the day and solar radiation moist loose snow avalanches are possible.

region C

Moderate (2=)

Wind slab, Persistent weak layers

Avalanche prone locations

Danger description

The somewhat older wind slabs of the last few days are in some cases still prone to triggering. Single winter sport participants can release avalanches. These can in isolated cases penetrate near-ground layers of the snowpack and reach dangerously large size. Such avalanche prone locations are to be found in particular in little used backcountry terrain. Ski touring and other off-piste activities, including snowshoe hiking, call for careful route selection.

Moderate (2)

Gliding snow

In particular on steep sunny slopes individual gliding avalanches are possible below approximately 2400 m. These can in some cases reach large size. Caution is to be exercised in areas with glide cracks. As a consequence of warming during the day and solar radiation moist loose snow avalanches are possible.

region D

Moderate (2=)

Wind slab, Persistent weak layers

Avalanche prone locations

Danger description

The somewhat older wind slabs of the last few days are in some cases still prone to triggering. Single winter sport participants can release avalanches. These can in isolated cases penetrate near-ground layers of the snowpack and reach dangerously large size. Such avalanche prone locations are to be found in particular in little used backcountry terrain.

Ski touring and other off-piste activities, including snowshoe hiking, call for careful route selection.

region E

Moderate (2-)

No distinct avalanche problem

Avalanche prone locations

Danger description

Individual avalanche prone locations are to be found in particular on very steep shady slopes. Mostly avalanches are small.

Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

region F

Low (1)

No distinct avalanche problem

Individual avalanche prone locations are to be found in particular in extremely steep terrain. Restraint should be exercised because avalanches can sweep people along and give rise to falls.

region G

Low (1)

Wind slab

The somewhat older wind slabs are in individual cases still prone to triggering. They are mostly rather small. Caution is to be exercised in particular in extremely steep terrain. Even a small avalanche can sweep snow sport participants along and give rise to falls.

Low (1)

Gliding snow

In particular on steep sunny slopes individual gliding avalanches are possible. Caution is to be exercised in areas with glide cracks. In addition moist snow slides are possible.

Snowpack and weather
