Tendency: Decreasing avalanche danger
on Sunday 06 04 2025

Wet snow

1600m

Snowpack stability: **poor**

Frequency: **many**

Avalanche size: **large**

Wet snow

1600m

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **medium**

Wind slab

1900m

Snowpack stability: **fair**

Frequency: **some**

Avalanche size: **medium**

As a consequence of warming during the day and solar radiation the avalanche prone locations will become more prevalent as the day progresses. Backcountry tours should be started and concluded early.

As the day progresses as a consequence of warming during the day and solar radiation there will be a gradual increase in the danger of moist and wet avalanches. The avalanche prone locations are to be found in particular at the base of rock walls and behind abrupt changes in the terrain and adjacent to ridgelines and in gullies and bowls. In addition the wind slabs must be taken into account. In particular at intermediate and high altitudes the avalanches can penetrate even deep layers. Gliding avalanches can also occur.

The avalanches can be released, even by small loads in isolated cases. In many places there is a danger of falling on the hard snow surface.

Snowpack

The surface of the snowpack will freeze to form a strong crust and will soften during the day. The weather

conditions will give rise to thorough wetting of the snowpack. Weak layers exist in the snowpack.

Tendency

Over a wide area strong wind.

As a consequence of falling temperatures, the avalanche activity will gradually decrease.

Danger Level 2 - Moderate

AM:

Tendency: Constant avalanche danger →
on Sunday 06 04 2025

Wet snow

1600m

Snowpack stability: **fair**
Frequency: **few**
Avalanche size: **medium**

Wind slab

1800m

Snowpack stability: **fair**
Frequency: **few**
Avalanche size: **medium**

Snowpack stability: **fair**
Frequency: **some**
Avalanche size: **medium**

As a consequence of warming during the day and solar radiation the avalanche prone locations will become more prevalent as the day progresses. Backcountry tours should be started and concluded early.

As the day progresses as a consequence of warming during the day and solar radiation there will be a gradual increase in the danger of moist and wet avalanches. The avalanche prone locations are to be found in particular on steep shady slopes and adjacent to ridgelines and in gullies and bowls. Gliding avalanches can also occur.

The avalanches can be released by large loads.

Snowpack

The weather conditions will give rise to thorough wetting of the snowpack over a wide area. On sunny slopes no snow is lying at low and intermediate altitudes.

Tendency

Over a wide area strong wind.

As a consequence of falling temperatures, the avalanche activity will gradually decrease.
