Wet snow

Snowpack stability: **poor**  
Frequency: **some**  
Avalanche size: **medium**

Outgoing longwave radiation during the night will be quite good. Mainly in the east of the Region; more cloudy in the morning in the west.  
The backcountry touring conditions at high altitude are generally favourable.  
The weather will be mild. As the day progresses as a consequence of warming during the day and solar radiation there will be an increase in the avalanche danger to level 2 (moderate).  
In particular on extremely steep slopes small and medium-sized moist and wet avalanches are possible.  
Backcountry tours should be concluded timely.  
The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

**Snowpack**

**Danger patterns** dp.10: springtime scenario

2 to 5 cm of snow fell on Sunday above approximately 2700 m. The surface of the snowpack has frozen to form a strong crust only at high altitudes.  
The weather conditions facilitated a gradual strengthening of the snowpack.  
Below approximately 2100 m a little snow is lying.

**Tendency**

The backcountry touring conditions in the morning, after a clear night, are favourable. As the day progresses as a consequence of warming during the day and solar radiation there will be an increase in the danger of moist and wet avalanches for a short time.
