

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger** →

on Sunday 30 03 2025

Wind slab

Snowpack stability: **fair**

Frequency: **few**

Avalanche size: **large**

Persistent weak layer

Snowpack stability: **poor**

Frequency: **few**

Avalanche size: **medium**

Wet snow

Snowpack stability: **poor**

Frequency: **few**

Avalanche size: **medium**

Wind slabs and wet snow represent the main danger. Weak layers in the old snowpack necessitate defensive route selection.

The avalanche prone locations are covered with new snow and are difficult to recognise, in particular in gullies and bowls, and behind abrupt changes in the terrain. In particular in east to south to west facing aspects and below approximately 2300 m medium-sized and large avalanches are possible as a consequence of warming during the day and solar radiation. Weak layers exist in the snowpack in shady places that are protected from the wind. Dry avalanches can be released, mostly by large loads and reach large size in isolated cases.

## Snowpack

**Danger patterns**

dp.10: springtime scenario

dp.1: deep persistent weak layer

Large-grained weak layers exist in the snowpack on shady slopes. This applies especially at transitions from a shallow to a deep snowpack, when entering gullies and bowls for example.

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger** →  
on Sunday 30 03 2025

Wet snow

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **medium**

Gliding snow

Snowpack stability: **fair**

Frequency: **few**

Avalanche size: **small**

The meteorological conditions fostered a strengthening of the snowpack in particular on east, south and west facing slopes.

Outgoing longwave radiation during the night will be good. The surface of the snowpack has frozen to form a strong crust and will soften during the day. A few gliding avalanches and moist snow slides are possible.

### Snowpack

#### Danger patterns

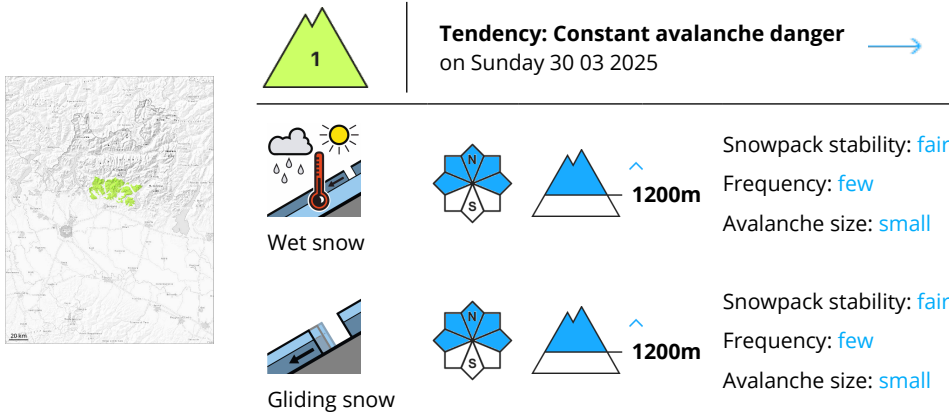

dp.2: gliding snow

dp.10: springtime scenario

As a consequence of warming during the day, the likelihood of wet loose snow avalanches being released will increase gradually in particular on steep grassy slopes in all altitude zones.

Danger Level 1 - Low

Moist and wet snow slides and small avalanches are possible in isolated cases.

Individual small moist and wet avalanches are possible.
