

Danger Level 2 - Moderate

New snow and wind slabs represent the main danger.

The avalanche prone locations are to be found in particular adjacent to ridgelines above approximately 2000 m and in gullies and bowls, and behind abrupt changes in the terrain. Wind-loaded slopes where weaknesses exist in the old snowpack are unfavourable.

Snowpack

Danger patterns dp.6: cold, loose snow and wind dp.1: deep persistent weak layer

The snowpack will become in some cases unfavourable. In the course of the day sometimes deep wind slabs will form especially adjacent to ridgelines and in gullies and bowls. Also shady slopes where weaknesses exist in the old snowpack are dangerous.

Danger Level 1 - Low

Tendency: Increasing avalanche danger 
on Tuesday 11 03 2025

New snow

1300m

Snowpack stability: **fair**

Frequency: **some**

Avalanche size: **small**

Natural dry avalanches are possible in isolated cases.
The new snow and wind slabs can be released naturally especially on shady slopes.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

dp.2: gliding snow

As a consequence of highly fluctuating temperatures and solar radiation the snowpack consolidated. In many cases new snow is lying on a moist old snowpack.
