

Avalanche danger
updated on 28.11.2024, 17:00

region A

Considerable (3-)

New snow

Avalanche prone locations

Danger description

As a consequence of new snow and a strong wind, sometimes large wind slabs formed at elevated altitudes. The new snow and wind slabs are prone to triggering. Individual natural avalanches are possible, this applies in particular during the first half of the night. Persons can release avalanches, including medium-sized ones. Backcountry touring calls for experience in the assessment of avalanche danger.

Low (1)

Gliding snow

Small and, in isolated cases, medium-sized gliding avalanches are possible below approximately 2200 m. Areas with glide cracks are to be avoided as far as possible.

region B

Moderate (2+)

Wind slab

Avalanche prone locations

Danger description

As a consequence of new snow and a strong wind, avalanche prone wind slabs formed at elevated altitudes. They are to be evaluated with care and prudence in steep terrain. Avalanches can reach medium size.

Low (1)

Gliding snow

Small and, in isolated cases, medium-sized gliding avalanches are possible below approximately 2200 m. Areas with glide cracks are to be avoided as far as possible.

region C

Moderate (2=)

Wind slab

Avalanche prone locations

Danger description

Fresh and older wind slabs are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain. They can still be released in some cases. Avalanches can reach medium size in isolated cases. Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

High Alpine regions: Avalanches can in isolated cases be released in near-ground layers. Here the avalanche danger is a little higher.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Low (1)

Gliding snow

Small and, in isolated cases, medium-sized gliding avalanches are possible below approximately 2200 m. Areas with glide cracks are to be avoided as far as possible.

region D

Moderate (2=)

Wind slab

Avalanche prone locations

Danger description

Fresh and older wind slabs are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain. They can still be released in some cases. Avalanches can reach medium size in isolated cases. Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

High Alpine regions: Avalanches can in isolated cases be released in near-ground layers. Here the avalanche danger is a little higher.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

region E

Moderate (2-)

Wind slab

Avalanche prone locations

Danger description

At intermediate and high altitudes thus far only a little snow is lying. The fresh and older wind slabs are in some cases still prone to triggering. They are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain. Mostly avalanches are small. The wind slabs are to be evaluated with care and prudence in particular in very steep terrain.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

region F

Low (1)

Gliding snow

Small and, in isolated cases, medium-sized gliding avalanches are possible below approximately 2200 m. Areas with glide cracks are to be avoided as far as possible.

Snowpack and weather
