

Avalanche danger

updated on 28.4.2025, 17:00

Morning

As the day progresses

region A

Low (1) Dry avalanches, whole day

No distinct avalanche problem

Individual avalanche prone locations for dry avalanches are to be found in particular on extremely steep north facing slopes. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

Considerable (3) Wet-snow and gliding avalanches, as the day

Wet snow, Gliding snow

The old snowpack will become increasingly wet all the way through, also on steep north facing slopes at elevated altitudes.  
As a consequence of warming during the day and solar radiation medium-sized and large wet and gliding avalanches are to be expected. Isolated very large wet avalanches are possible in particular on north and east facing slopes. Caution is to be exercised in particular on west and east facing slopes below approximately 3200 m, as well as on north facing slopes below approximately 2800 m.  
Backcountry tours should be started very early and concluded timely.

region B

Moderate (2-) Dry avalanches, whole day

No distinct avalanche problem

Avalanche prone locations

Danger description

Dry avalanches can be released in near-surface layers in isolated cases. The avalanche prone locations are to be found in particular on very steep north facing slopes and adjacent to ridgelines and in pass areas. They can in isolated cases reach medium size. Careful route selection is recommended. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Considerable (3) Wet-snow and gliding avalanches, as the day

Wet snow, Gliding snow

The old snowpack will become increasingly wet all the way through, also on steep north facing slopes at elevated altitudes. As a consequence of warming during the day and solar radiation medium-sized and large wet and gliding avalanches are to be expected. Isolated very large wet avalanches are possible in particular on north and east facing slopes. Caution is to be exercised in particular on west and east facing slopes below approximately 3200 m, as well as on north facing slopes below approximately 2800 m. Backcountry tours should be started very early and concluded timely.

## region C

## Moderate (2-) Dry avalanches, whole day

## No distinct avalanche problem

## Avalanche prone locations

## Danger description

Dry avalanches can be released in near-surface layers in isolated cases. They can reach medium size. Additionally in very isolated cases avalanches can be released in the old snowpack and reach large size. Caution is to be exercised in particular on very steep north facing slopes in little used backcountry terrain. Careful route selection is recommended. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

## Considerable (3) Wet-snow and gliding avalanches, as the day

## Wet snow, Gliding snow

The old snowpack will become increasingly wet all the way through, also on steep north facing slopes at elevated altitudes.

As a consequence of warming during the day and solar radiation medium-sized and large wet and gliding avalanches are to be expected. Isolated very large wet avalanches are possible in particular on north and east facing slopes. Caution is to be exercised in particular on west and east facing slopes below approximately 3200 m, as well as on north facing slopes below approximately 2800 m.

Backcountry tours should be started very early and concluded timely.

## region D

## Low (1) Dry avalanches, whole day

## No distinct avalanche problem

Dry avalanches can in isolated cases be released by people and reach medium size. Caution is to be exercised in particular on extremely steep north facing slopes in little used backcountry terrain.

Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

## Considerable (3) Wet-snow and gliding avalanches, as the day

## Wet snow, Gliding snow

The old snowpack will become increasingly wet all the way through, also on steep north facing slopes at elevated altitudes.

As a consequence of warming during the day and solar radiation medium-sized and large wet and gliding avalanches are to be expected. Isolated very large wet avalanches are possible in particular on north and east facing slopes. Caution is to be exercised in particular on west and east facing slopes below approximately 3200 m, as well as on north facing slopes below approximately 2800 m.

Backcountry tours should be started very early and concluded timely.

region E

Moderate (2-) Dry avalanches, whole day

No distinct avalanche problem

Avalanche prone locations

Danger description

Dry avalanches can be released in near-surface layers in isolated cases. The avalanche prone locations are to be found in particular on very steep north facing slopes and adjacent to ridgelines and in pass areas. They can in isolated cases reach medium size. Careful route selection is recommended. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Moderate (2) Wet-snow and gliding avalanches, as the day progresses

Wet snow, Gliding snow

The old snowpack will become increasingly wet all the way through, also on steep north facing slopes at elevated altitudes. As a consequence of warming during the day and solar radiation medium-sized and, in isolated cases, large wet avalanches are possible. Caution is to be exercised in particular on west and east facing slopes below approximately 3200 m, as well as on north facing slopes below approximately 2800 m. Backcountry tours should be started very early and concluded timely.

region F

Moderate (2-) Dry avalanches, whole day

No distinct avalanche problem

Avalanche prone locations

Danger description

Dry avalanches can be released in near-surface layers in isolated cases. They can reach medium size. Additionally in very isolated cases avalanches can be released in the old snowpack and reach large size. Caution is to be exercised in particular on very steep north facing slopes in little used backcountry terrain. Careful route selection is recommended. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Moderate (2) Wet-snow and gliding avalanches, as the day progresses

Wet snow, Gliding snow

The old snowpack will become increasingly wet all the way through, also on steep north facing slopes at elevated altitudes. As a consequence of warming during the day and solar radiation medium-sized and, in isolated cases, large wet avalanches are possible. Caution is to be exercised in particular on west and east facing slopes below approximately 3200 m, as well as on north facing slopes below approximately 2800 m. Backcountry tours should be started very early and concluded timely.

## region G

## Low (1) Dry avalanches, whole day

**No distinct avalanche problem**

Individual avalanche prone locations for dry avalanches are to be found in particular on extremely steep north facing slopes. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

## Moderate (2) Wet-snow and gliding avalanches, as the day progresses

**Wet snow, Gliding snow**

The old snowpack will become increasingly wet all the way through, also on steep north facing slopes at elevated altitudes.

As a consequence of warming during the day and solar radiation medium-sized and, in isolated cases, large wet avalanches are possible. Caution is to be exercised in particular on west and east facing slopes below approximately 3200 m, as well as on north facing slopes below approximately 2800 m.

Backcountry tours should be started very early and concluded timely.

## region H

## Low (1) Dry avalanches, whole day

**No distinct avalanche problem**

Dry avalanches can in isolated cases be released by people and reach medium size. Caution is to be exercised in particular on extremely steep north facing slopes in little used backcountry terrain.

Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

## Moderate (2) Wet-snow and gliding avalanches, as the day progresses

**Wet snow, Gliding snow**

The old snowpack will become increasingly wet all the way through, also on steep north facing slopes at elevated altitudes.

As a consequence of warming during the day and solar radiation medium-sized and, in isolated cases, large wet avalanches are possible. Caution is to be exercised in particular on west and east facing slopes below approximately 3200 m, as well as on north facing slopes below approximately 2800 m.

Backcountry tours should be started very early and concluded timely.

## Snowpack and weather

updated on 28.4.2025, 17:00

### Snowpack

Last week's fresh snow has largely settled. Dry slab avalanches are still possible, especially at high altitudes on steep north-facing slopes.

The old snowpack is water-saturated on southern slopes up to the high Alpine regions and on eastern and western slopes up to around 3000 m. On northern slopes, most of the old snowpack is water-saturated up to between 2600 and 2800 m. Wet avalanches, some very large, may still occur at these altitudes, because some weak layers deep in the snowpack are still dry and will become significantly less stable when they first become saturated. Such deep weak layers are particularly prevalent in the inneralpine regions.

### Weather review for Monday

In the north, conditions were only partly clear overnight and there was showery precipitation, while it was mainly sunny during the day. In the south, conditions were cloudy overnight and there was some precipitation, while there were sunny intervals during the day.

#### Fresh snow

On the Main Alpine Ridge and south of there, a few centimetres above around 2400 m

#### Temperature

At midday at 2000 m, around +7 °C

#### Wind

On the northern flank of the Alps, sometimes moderate from the southeast overnight, elsewhere mostly light

### Weather forecast to Tuesday

The night to Tuesday will be partly clear. The daytime will mainly be sunny. Cumulus cloud will develop in the afternoon and there may be isolated showers.

#### Fresh snow

-

#### Temperature

At midday at 2000 m around +8 °C; the zero-degree level will rise to around 3200 m

#### Wind

Mostly light from variable directions

### Outlook

Conditions will mainly be clear overnight to Wednesday and Thursday. The mornings will be mainly sunny. Cumulus cloud will develop in the afternoons and there may be isolated showers and thunderstorms. The zero-degree level will rise to around 3200 m on Wednesday and to 3400 m on Thursday. Winds will be light on both days.

The risk of dry avalanches will continue to decrease, The risk of wet avalanches will increase significantly over the course of each day. Ski touring should be started very early and finished early.
