

Avalanche danger
updated on 29.4.2025, 17:00

Morning

As the day progresses

region A

Low (1) Dry avalanches, whole day

No distinct avalanche problem
Individual avalanche prone locations for dry avalanches are to be found in particular on extremely steep north facing slopes. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.
The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Considerable (3) Wet-snow and gliding avalanches, as the day

Wet snow, Gliding snow
The old snowpack will become increasingly wet all the way through, also on steep north facing slopes at elevated altitudes.
As a consequence of warming during the day and solar radiation medium-sized and large wet and gliding avalanches are to be expected. Caution is to be exercised in particular on west and east facing slopes below approximately 3200 m, as well as on north facing slopes below approximately 2800 m.
Backcountry tours should be started early and concluded timely.

region B

Moderate (2-) Dry avalanches, whole day

No distinct avalanche problem

Avalanche prone locations

Danger description

Dry avalanches can be released in near-surface layers in isolated cases. They can reach medium size. Additionally in very isolated cases avalanches can be released in the old snowpack and reach large size. Caution is to be exercised in particular on very steep north facing slopes in little used backcountry terrain. Careful route selection is recommended. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Considerable (3) Wet-snow and gliding avalanches, as the day

Wet snow, Gliding snow

The old snowpack will become increasingly wet all the way through, also on steep north facing slopes at elevated altitudes.

As a consequence of warming during the day and solar radiation medium-sized and large wet and gliding avalanches are to be expected. Caution is to be exercised in particular on west and east facing slopes below approximately 3200 m, as well as on north facing slopes below approximately 2800 m.

Backcountry tours should be started early and concluded timely.

region C

Low (1) Dry avalanches, whole day

No distinct avalanche problem

Dry avalanches can in isolated cases be released by people and reach medium size. Caution is to be exercised in particular on extremely steep north facing slopes in little used backcountry terrain. Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Considerable (3) Wet-snow and gliding avalanches, as the day

Wet snow, Gliding snow

The old snowpack will become increasingly wet all the way through, also on steep north facing slopes at elevated altitudes.

As a consequence of warming during the day and solar radiation medium-sized and large wet and gliding avalanches are to be expected. Caution is to be exercised in particular on west and east facing slopes below approximately 3200 m, as well as on north facing slopes below approximately 2800 m.

Backcountry tours should be started early and concluded timely.

region D

Moderate (2-) Dry avalanches, whole day

No distinct avalanche problem

Avalanche prone locations

Danger description

Dry avalanches can be released in near-surface layers in isolated cases. They can reach medium size. Additionally in very isolated cases avalanches can be released in the old snowpack and reach large size. Caution is to be exercised in particular on very steep north facing slopes in little used backcountry terrain. Careful route selection is recommended. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Moderate (2) Wet-snow and gliding avalanches, as the day progresses

Wet snow, Gliding snow

The old snowpack will become increasingly wet all the way through, also on steep north facing slopes at elevated altitudes. As a consequence of warming during the day and solar radiation medium-sized and, in isolated cases, large wet and gliding avalanches are to be expected. Caution is to be exercised in particular on west and east facing slopes below approximately 3200 m, as well as on north facing slopes below approximately 2800 m. Backcountry tours should be started early and concluded timely.

region E

Low (1) Dry avalanches, whole day

No distinct avalanche problem

Individual avalanche prone locations for dry avalanches are to be found in particular on extremely steep north facing slopes. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Moderate (2) Wet-snow and gliding avalanches, as the day progresses

Wet snow, Gliding snow

The old snowpack will become increasingly wet all the way through, also on steep north facing slopes at elevated altitudes. As a consequence of warming during the day and solar radiation medium-sized and, in isolated cases, large wet and gliding avalanches are to be expected. Caution is to be exercised in particular on west and east facing slopes below approximately 3200 m, as well as on north facing slopes below approximately 2800 m. Backcountry tours should be started early and concluded timely.

region F

Low (1) Dry avalanches, whole day

**No distinct avalanche problem**

Dry avalanches can in isolated cases be released by people and reach medium size. Caution is to be exercised in particular on extremely steep north facing slopes in little used backcountry terrain. Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Moderate (2) Wet-snow and gliding avalanches, as the day progresses**Wet snow, Gliding snow**

The old snowpack will become increasingly wet all the way through, also on steep north facing slopes at elevated altitudes.

As a consequence of warming during the day and solar radiation medium-sized and, in isolated cases, large wet and gliding avalanches are to be expected. Caution is to be exercised in particular on west and east facing slopes below approximately 3200 m, as well as on north facing slopes below approximately 2800 m.

Backcountry tours should be started early and concluded timely.

Snowpack and weather

updated on 29.4.2025, 17:00

Snowpack

Avalanches may still be triggered in dry snow, primarily in the high Alpine regions and especially on steep north-facing slopes. The old snowpack is water-saturated on southern slopes up to the high Alpine regions and on eastern and western slopes up to around 3000 m. On northern slopes, most of the old snowpack is water-saturated up to between 2600 and 2800 m. Large wet avalanches may still occur at these altitudes because some weak layers deep in the snowpack are still dry and will become significantly less stable when they first become saturated.

After a mostly clear night, the surface of the snowpack will be stable above around 2200 m early on Wednesday morning. Over the course of the morning, it will soften rapidly in the sunshine and rising temperatures and the risk of wet avalanches will increase.

Weather review for Tuesday

There were clear intervals overnight. During the day, conditions were sunny with cumulus clouds in the afternoon and localised showers.

Fresh snow

-

Temperature

At midday at 2000 m about +8 °C; zero-degree level about 3100 m.

Wind

Mostly light from variable directions

Weather forecast to Wednesday

Conditions will be mainly clear overnight to Wednesday. There will be sunshine during the day with cumulus clouds and isolated showers in the afternoon.

Fresh snow

-

Temperature

At midday at 2000 m about +9 °C; zero-degree level about 3200 m.

Wind

Mostly light from variable directions

Outlook

Conditions will be mainly clear overnight to Thursday and Friday. There will be sunshine each day and, in the afternoons, cumulus clouds will develop and there may be showers. The zero-degree level will be between 3300 and 3600 m. Winds will mainly be light.

The risk of dry avalanches will continue to decrease. The risk of wet avalanches will increase significantly over the course of each day. Ski touring should be started very early and finished early.
