## Danger Level 2 - Moderate

**AM:**

**Tendency: Constant avalanche danger** →  
on Thursday 01 05 2025

**PM:**

**Tendency: Constant avalanche danger** →  
on Thursday 01 05 2025

Wet snow

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **medium**

Outgoing longwave radiation during the night will be quite good.  
The backcountry touring conditions at high altitude are generally favourable.

The weather will be mild. As the day progresses as a consequence of warming during the day and solar radiation there will be an increase in the avalanche danger to level 2 (moderate).

In particular on extremely steep slopes small and medium-sized moist and wet avalanches are possible.

Backcountry tours should be started very early and concluded timely.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

## Snowpack

**Danger patterns**

dp.10: springtime scenario

Outgoing longwave radiation during the night was good.

The weather conditions facilitated a gradual strengthening of the snowpack.

Below approximately 2100 m a little snow is lying.

## Tendency

The backcountry touring conditions in the morning, after a clear night, are generally favourable. The surface of the snowpack will freeze to form a strong crust and will soften earlier than the day before. As the day progresses as a consequence of warming during the day and solar radiation there will be a rapid increase in the danger of moist and wet avalanches.
