

Avalanche danger
updated on 3.4.2024, 17:00

region A Considerable (3-)

Wind slab, Persistent weak layers

Avalanche prone locations

Danger description

The fresh and older wind slabs are in some cases prone to triggering at elevated altitudes. Avalanches can in very isolated cases penetrate deep layers and reach large size, especially in areas where the snow cover is rather shallow. The avalanche prone locations are barely recognisable, even to the trained eye. Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger and careful route selection.

Moderate (2)

Wet snow, Gliding snow

Avalanche prone locations

Danger description

In particular on steep grassy slopes large gliding avalanches are possible. Gliding avalanches can be released at any time of day or night. Areas with glide cracks are to be avoided. As a consequence of solar radiation more frequent moist snow slides and avalanches are possible as the day progresses.

region B

Considerable (3-)

Wind slab

Avalanche prone locations

Danger description

The fresh and older wind slabs must be evaluated with care and prudence at elevated altitudes. Single winter sport participants can release avalanches. Avalanches can reach large size in isolated cases. Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger.

Moderate (2)

Wet snow, Gliding snow

Avalanche prone locations

Danger description

In particular on steep grassy slopes large gliding avalanches are possible. Gliding avalanches can be released at any time of day or night. Areas with glide cracks are to be avoided. As a consequence of solar radiation more frequent moist snow slides and avalanches are possible as the day progresses.

region C

Moderate (2+)

Wind slab

Avalanche prone locations

Danger description

The fresh and older wind slabs represent the main danger. Single winter sport participants can release avalanches in some places, including medium-sized ones. Backcountry touring and other off-piste activities call for careful route selection.

Moderate (2)

Wet snow, Gliding snow

Avalanche prone locations

Danger description

In particular on steep grassy slopes large gliding avalanches are possible. Gliding avalanches can be released at any time of day or night. Areas with glide cracks are to be avoided. As a consequence of solar radiation more frequent moist snow slides and avalanches are possible as the day progresses.

region D

Moderate (2-)

Wind slab

Avalanche prone locations

Danger description

The fresh and somewhat older wind slabs are in some cases prone to triggering. The avalanche prone locations are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain. Avalanches can be released by a single winter sport participant, but they will be small in most cases. Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

Low (1)

Gliding snow

In particular on steep grassy slopes individual gliding avalanches are possible. These can in some cases reach medium size. Areas with glide cracks are to be avoided as far as possible.

region E

Moderate (2-)

Wind slab

Avalanche prone locations

Danger description

The fresh and somewhat older wind slabs are in some cases prone to triggering. The avalanche prone locations are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain. Avalanches can be released by a single winter sport participant, but they will be small in most cases. Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

Moderate (2)

Wet snow, Gliding snow

Avalanche prone locations

Danger description

In particular on steep grassy slopes large gliding avalanches are possible. Gliding avalanches can be released at any time of day or night. Areas with glide cracks are to be avoided. As a consequence of solar radiation more frequent moist snow slides and avalanches are possible as the day progresses.

region F

Low (1)

Gliding snow
In particular on steep grassy slopes individual gliding avalanches are possible. These can in some cases reach medium size.
Areas with glide cracks are to be avoided as far as possible.

Snowpack and weather
