Danger Level 2 - Moderate

Tendency: Increasing avalanche danger  
on Tuesday 15 04 2025

Wind slab

Snowpack stability: poor

Frequency: some

Avalanche size: medium

Persistent  
weak layer

Snowpack stability: poor

Frequency: some

Avalanche size: medium

Wet snow

Snowpack stability: poor

Frequency: few

Avalanche size: medium

Wind slabs and wet snow represent the main danger. As a consequence of a strong wind, easily released wind slabs formed in particular adjacent to ridgelines on south, east and west facing slopes.

In the last few days mostly small wind slabs formed as well. The avalanche prone locations are clearly recognisable to the trained eye, especially adjacent to ridgelines, in particular in the central part of the main Alpine ridge. Weak layers exist in the snowpack in shady places that are protected from the wind. Dry avalanches can still be released, mostly by large loads. As a consequence of the rain more mostly small moist and wet avalanches are possible below approximately 2300 m.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

dp.10: springtime scenario

Large-grained weak layers exist in the snowpack on shady slopes. This applies especially at transitions from a shallow to a deep snowpack, when entering gullies and bowls for example. Some fresh snow and in particular the mostly small wind slabs that are forming at high altitude will be deposited on a weakly bonded old snowpack. The rain will give rise in the afternoon to rapid moistening of the snowpack in some places below approximately 2300 m.

Danger Level 2 - Moderate

AM:

Tendency: Constant avalanche danger  
on Tuesday 15 04 2025

Wet snow

1400m

Snowpack stability: fair

Frequency: few

Avalanche size: small

Gliding snow

1400m

Snowpack stability: fair

Frequency: few

Avalanche size: small

PM:

1400m

Tendency: Constant avalanche danger  
on Tuesday 15 04 2025

Wet snow

1400m

Snowpack stability: poor

Frequency: few

Avalanche size: medium

Gliding snow

1400m

Snowpack stability: poor

Frequency: few

Avalanche size: medium

With the onset of the rainfall, the natural activity of small moist and wet avalanches will increase. Gliding avalanches can also be released in the morning on rare occasions.

The surface of the snowpack cooled hardly at all during the overcast night and will soften quickly. A few gliding avalanches and moist snow slides are possible.

Snowpack

Danger patterns

dp.2: gliding snow

dp.10: springtime scenario

As a consequence of warming during the day, the likelihood of moist loose snow avalanches being released will increase a little in particular on steep grassy slopes in all altitude zones.
