

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Saturday 01 03 2025

Wet snow

1400m

Snowpack stability: **poor**

Frequency: **few**

Avalanche size: **small**

Wet snow represents the main danger.

Wet snow slides are possible in isolated cases. They are small.

Snowpack

At low and intermediate altitudes no snow is lying. At high altitude hardly any snow is lying. The weather conditions will give rise to increasing and thorough wetting of the old snowpack.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Saturday 01 03 2025

Wet snow

1800m

Snowpack stability: **poor**

Frequency: **few**

Avalanche size: **small**

Wet snow represents the main danger.

Above approximately 1800 m and on very steep slopes individual moist slab avalanches are possible, but they will be mostly small. Gullies and bowls are especially unfavourable.

Snowpack

The old snowpack will be generally stable. The older wind slabs have formed in particular in gullies and bowls, and behind abrupt changes in the terrain. The weather conditions will give rise to increasing moistening of the snowpack.
