Wet snow

Snowpack stability: **poor**

Frequency: **few**

Avalanche size: **medium**

Wind slab

Snowpack stability: **poor**

Frequency: **few**

Avalanche size: **medium**

The backcountry touring conditions remain favourable.

As a consequence of a moderate to strong wind from northwesterly directions, mostly small wind slabs formed in particular at high altitudes and in high Alpine regions. The clearly visible wind slabs of the last two days can be released by a single winter sport participant in some cases, in particular on extremely steep slopes.

As the day progresses as a consequence of warming during the day and solar radiation there will be a gradual increase in the danger of moist and wet avalanches, especially on east, south and west facing slopes below approximately 3000 m, and on north facing slopes below approximately 2700 m.

Snowpack

Until the evening the wind will be moderate to strong.

Outgoing longwave radiation during the night will be good. The surface of the snowpack will freeze to form a strong crust will soften during the day.

2 to 10 cm of snow fell on Wednesday above approximately 2500 m.

The weather conditions facilitated a gradual strengthening of the snowpack. Towards its surface, the snowpack is moist and its surface has a crust that is strong in many cases.

Below approximately 2100 m a little snow is lying.

Tendency

The backcountry touring conditions in the morning, after a clear night, are favourable. As the day progresses as a consequence of warming during the day and solar radiation there will be an increase in the

danger of moist and wet avalanches.
