

Danger Level 2 - Moderate

The surface of the snowpack is frozen, but not to a significant depth and will soften during the day. In particular adjacent to ridgelines on north facing slopes sometimes large wind slabs formed.

The visible wind slabs can be released, especially by large additional loads, in particular on steep north facing slopes above approximately 2500 m. Soft weak layers exist in the snowpack in particular on shady slopes.

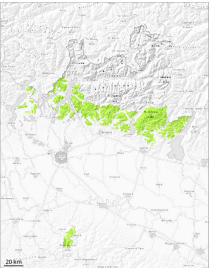

Snowpack

**Danger patterns** dp.1: deep persistent weak layer dp.4: cold following warm / warm following cold

The snowpack will become in some cases unfavourable. In the last few days visible wind slabs formed especially adjacent to ridgelines and in gullies and bowls. Also shady slopes where weaknesses exist in the old snowpack are dangerous. Whumpfung sounds and the formation of shooting cracks when stepping on the snowpack serve as an alarm indicating the danger.

Danger Level 1 - Low

**Tendency: Constant avalanche danger**

on Monday 24 02 2025

Wet snow

1500m

Snowpack stability: fair

Frequency: few

Avalanche size: small

Small avalanches are possible in isolated cases.

There is a danger of moist snow slides during the day.

Snowpack

**Danger patterns**

dp.10: springtime scenario

As a consequence of low temperatures and solar radiation the snowpack consolidated during the last few days.
