

Avalanche danger  
updated on 4.10.2025, 17:00

region A

Moderate (2+)

Wind slab

Avalanche prone locations

Danger description

30 cm of snow will fall until midday above approximately 2500 m. During the night the wind will be strong to storm force for a temporary period. As a consequence of new snow and a strong wind from westerly directions, easily released wind slabs will form. Single persons can release avalanches, including medium-sized ones. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls. The Avalanche Warning Service currently has only a small amount of information, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

region B

Moderate (2=)

Wind slab

Avalanche prone locations

Danger description

Up to 20 cm of snow will fall until midday above approximately 2500 m. During the night the wind will be strong to storm force for a temporary period. As a consequence of new snow and a strong wind from westerly directions, mostly small wind slabs will form in some places. Even a small avalanche can sweep people along and give rise to falls. The Avalanche Warning Service currently has only a small amount of information, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

region C

Low (1)

No distinct avalanche problem

Avalanche prone locations

Danger description

Up to 20 cm of snow will fall until midday above approximately 2200 m. On very steep grassy slopes moist snow slides are possible. Even a small avalanche can sweep people along and give rise to falls.

region D

Low (1)

Wind slab

Avalanche prone locations

Danger description

As a consequence of a strong northwesterly wind, small wind slabs will form in some localities. The number and size of avalanche prone locations will increase with altitude. Even a small avalanche can sweep people along and give rise to falls. The Avalanche Warning Service currently has only a small amount of information, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

## Snowpack and weather

updated on 4.10.2025, 17:00

### Snowpack

At the beginning of October, there was already a thin snowpack, particularly in the high alpine regions and on north-facing slopes above 2600 to 2800 metres. On steep north-facing slopes, the snow cover is often faceted.

### Outlook

On Monday, there will be intermittent snowfall in the north and east. The snowfall limit will be between 1500 and 2000 metres. Up to 20 cm of snow may fall at high altitudes. Otherwise, it will be quite sunny. On Tuesday, it will be partly cloudy in the northeast and sunny elsewhere. It will become significantly warmer.

The danger of dry avalanches remains to be considered, especially on north-facing slopes above 2600 m and in high alpine regions in general. A single person can trigger small avalanches. On steep grassy slopes wet slides may occur. The risk of being swept away or falling must be taken into account.
