

Danger Level 2 - Moderate

Tendency: Constant avalanche danger
on Saturday 29 03 2025

Wind slab

Snowpack stability: fair
Frequency: few
Avalanche size: large

Persistent
weak layer

Snowpack stability: poor
Frequency: few
Avalanche size: medium

Wet snow

Snowpack stability: poor
Frequency: few
Avalanche size: medium

Wind slabs and wet snow represent the main danger. Weak layers in the old snowpack necessitate defensive route selection.

The avalanche prone locations are covered with new snow and are difficult to recognise, in particular in gullies and bowls, and behind abrupt changes in the terrain. In particular in east to south to west facing aspects and below approximately 2300 m medium-sized and large avalanches are possible as a consequence of warming during the day and solar radiation. Weak layers exist in the snowpack in shady places that are protected from the wind. Dry avalanches can be released, mostly by large loads and reach large size in isolated cases.

Snowpack

Danger patterns

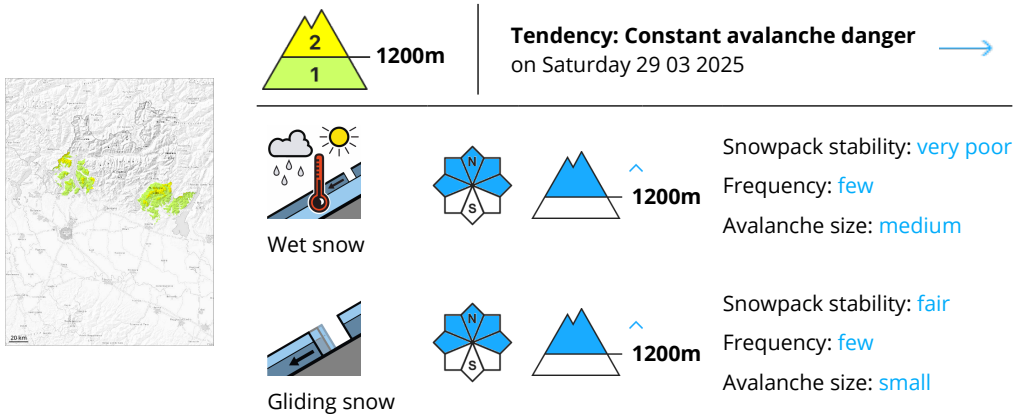

dp.10: springtime scenario

dp.1: deep persistent weak layer

Large-grained weak layers exist in the snowpack on shady slopes. This applies especially at transitions from a shallow to a deep snowpack, when entering gullies and bowls for example.

Danger Level 2 - Moderate

The meteorological conditions fostered a strengthening of the snowpack in particular on east, south and west facing slopes.

Outgoing longwave radiation during the night will be good. The surface of the snowpack has frozen to form a strong crust and will soften during the day. A few gliding avalanches and moist snow slides are possible.

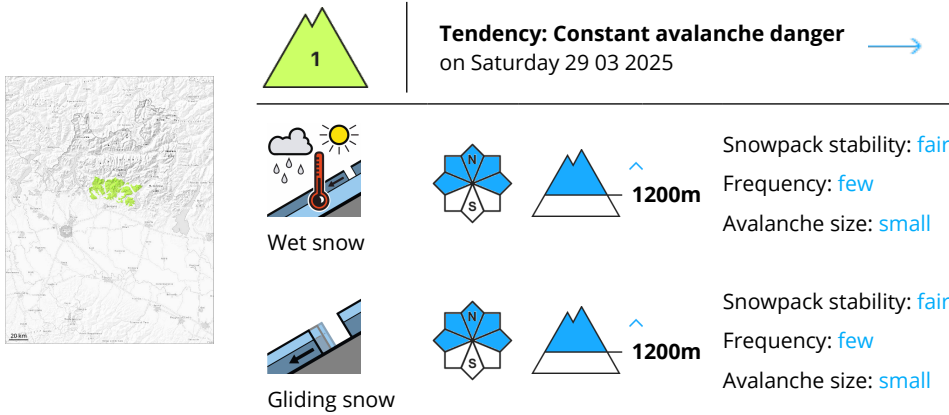

Snowpack

Danger patterns dp.2: gliding snow dp.10: springtime scenario

As a consequence of warming during the day, the likelihood of wet loose snow avalanches being released will increase gradually in particular on steep grassy slopes in all altitude zones.

Danger Level 1 - Low

Moist and wet snow slides and small avalanches are possible in isolated cases.

Individual small moist and wet avalanches are possible.
