

## Danger Level 3 - Considerable

**Tendency: Constant avalanche danger**  
on Friday 09 05 2025

New snow

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **large**

Wet snow

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **medium**

New snow and wet snow represent the main danger. Medium-sized and, in isolated cases, large moist and wet avalanches are possible above approximately 2200 m. As a consequence of warming during the day there will be a rapid increase in the danger of gliding avalanches and wet snow slides to level 3 (considerable).

Especially on very steep west, north and east facing slopes and above approximately 2700 m numerous medium-sized and large moist and wet avalanches are possible as a consequence of the snowfall. Wet avalanches can as before be released by a single winter sport participant.

As the day progresses as a consequence of the new snow there will be an increase in the danger of moist and wet avalanches. Individual gliding avalanches can also occur, caution is to be exercised in particular on very steep grassy slopes in the regions with a lot of snow.

## Snowpack

### Danger patterns

dp.10: springtime scenario

dp.6: cold, loose snow and wind

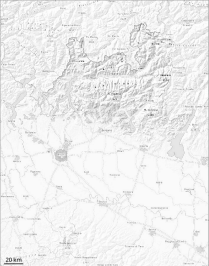

The sleet will give rise to unfavourable bonding of the snowpack. Below approximately 2200 m a little snow is lying.

Danger Level 2 - Moderate

Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Friday 09 05 2025

Wet snow

Snowpack stability: **fair**  
Frequency: **few**  
Avalanche size: **small**

Moist and wet avalanches are the main danger.

Outgoing longwave radiation during the night will be severely restricted. Individual small wet avalanches are possible.
