

Avalanche danger

updated on 27.4.2025, 17:00

Morning

As the day progresses

region A

Moderate (2=) Dry avalanches, whole day

Wind slab

Avalanche prone locations

Danger description

The somewhat older wind slabs are in some cases still prone to triggering at elevated altitudes. Winter sport participants can release avalanches in some places, including medium-sized ones. In high Alpine regions the avalanche prone locations are more prevalent. Careful route selection is recommended.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Moderate (2) Wet-snow avalanches, as the day progresses

Wet snow

The weather will be mild. As a consequence of warming during the day and solar radiation medium-sized and, in isolated cases, large wet avalanches are possible. Caution is to be exercised in particular on west and east facing slopes below approximately 3000 m, as well as on north facing slopes below approximately 2600 m. Backcountry tours should be concluded timely.

## region B

## Moderate (2-) Dry avalanches, whole day

## No distinct avalanche problem

## Avalanche prone locations

## Danger description

Dry avalanches can be released in near-surface layers in isolated cases. They can reach medium size. Additionally in very isolated cases avalanches can be released in the old snowpack and reach large size. Caution is to be exercised in particular on very steep shady slopes in little used backcountry terrain. Careful route selection is recommended. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

## Moderate (2) Wet-snow avalanches, as the day progresses

## Wet snow

The weather will be mild. As a consequence of warming during the day and solar radiation medium-sized and, in isolated cases, large wet avalanches are possible. Caution is to be exercised in particular on west and east facing slopes below approximately 3000 m, as well as on north facing slopes below approximately 2600 m. Backcountry tours should be concluded timely.

## region C

## Moderate (2-) Dry avalanches, whole day

## No distinct avalanche problem

## Avalanche prone locations

## Danger description

Dry avalanches can be released in near-surface layers in isolated cases. The avalanche prone locations are to be found in particular on very steep north facing slopes and adjacent to ridgelines and in pass areas in all aspects. They can in isolated cases reach medium size. Careful route selection is recommended. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

## Moderate (2) Wet-snow avalanches, as the day progresses

## Wet snow

The weather will be mild. As a consequence of warming during the day and solar radiation medium-sized and, in isolated cases, large wet avalanches are possible. Caution is to be exercised in particular on west and east facing slopes below approximately 3000 m, as well as on north facing slopes below approximately 2600 m. Backcountry tours should be concluded timely.

region D

Moderate (2-) Dry avalanches, whole day

No distinct avalanche problem

Avalanche prone locations

Danger description

Dry avalanches can be released in near-surface layers in isolated cases. Additionally in very isolated cases avalanches can be released in the old snowpack. Mostly avalanches are medium-sized. Caution is to be exercised in particular on very steep shady slopes in little used backcountry terrain. Careful route selection is recommended. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Moderate (2) Wet-snow avalanches, as the day progresses

Wet snow

The weather will be mild. As a consequence of warming during the day and solar radiation medium-sized and, in isolated cases, large wet avalanches are possible. Caution is to be exercised in particular on west and east facing slopes below approximately 3000 m, as well as on north facing slopes below approximately 2600 m. Backcountry tours should be concluded timely.

region E

Low (1) Dry avalanches, whole day

No distinct avalanche problem

Individual avalanche prone locations for dry avalanches are to be found in particular on extremely steep shady slopes. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

Moderate (2) Wet-snow avalanches, as the day progresses

Wet snow

The weather will be mild. As a consequence of warming during the day and solar radiation medium-sized and, in isolated cases, large wet avalanches are possible. Caution is to be exercised in particular on west and east facing slopes below approximately 3000 m, as well as on north facing slopes below approximately 2600 m. Backcountry tours should be concluded timely.

**Avalanche bulletin through Monday, 28. April 2025****Snowpack and weather**

updated on 27.4.2025, 17:00

**Snowpack**

Last week's fresh snow fell in places on a dry and loose old snow surface, especially in the high Alpine regions on steep northern slopes where dry slab avalanches are most likely to be triggered at the transition to the old snowpack. The instabilities within the layers of fresh and drifted snow have largely stabilised.

The old snowpack is water-saturated on southern slopes up to the high Alpine regions and on eastern and western slopes up to around 3000 m. On northern slopes, most of the old snowpack is water-saturated up to 2600 to 2800 m and wet slab avalanches can still occur at these altitudes, as individual weak layers deep in the snowpack are still dry and become substantially less stable when they first become saturated. This is particularly true in the inneralpine regions of Grisons.

**Weather review for Sunday**

Conditions were mainly cloudy overnight to Sunday. During the day, conditions were initially sunny in the west and north, but elsewhere mostly cloudy. There was little precipitation, falling as snow above 2300 m, on the Main Alpine Ridge and south of there.

**Fresh snow**

A few centimetres may fall in places above 2300 m on the Main Alpine Ridge.

**Temperature**

At midday at 2000 m, +6 °C

**Wind**

- Moderate at times during the night from the southeast on the northern flank of the Alps
- Elsewhere light from various directions

**Weather forecast to Monday**

In the north, the first half of the night on Monday will still be partly cloudy, but the clouds will start clearing from midnight. During the day, conditions will be mostly sunny, with local showers or thunderstorms in places in the afternoon. In the south, there will be heavy cloud cover overnight with little precipitation. During the day, conditions will become increasingly sunny, while cumulus cloud will develop in the afternoon and there may be isolated showers.

**Fresh snow**

Above approximately 2300 m, a few centimetres will fall on the central part of the Main Alpine Ridge.

**Temperature**

At midday at 2000 m, +7 °C

**Wind**

Light from various directions

**Outlook**

The nights to Tuesday and Wednesday will mostly be clear. Conditions will be mostly sunny in the morning. Cumulus cloud will develop in the afternoon and there may be showers and thunderstorms. The zero-degree level will rise to around 3000 m on Tuesday and to around 3200 m on Wednesday. Winds will be light on both days.

The risk of dry avalanches will continue to decrease, The risk of wet avalanches is subject to daytime changes. Touring skiing should be completed in good time.
