

Avalanche danger

updated on 5.4.2024, 17:00

Morning

As the day progresses

region A

Moderate (2+) Dry avalanches, whole day

Persistent weak layers

Avalanche prone locations

Danger description

Dry avalanches can in particular be released in near-surface layers of the snowpack. In some places avalanches can also be released in deep layers. This applies especially in little used terrain. Avalanches can reach large size. The avalanche prone locations are barely recognisable, even to the trained eye. Backcountry touring and other off-piste activities call for defensive route selection.

Considerable (3) Wet-snow avalanches, as the day progresses

Wet snow, Gliding snow

Avalanche prone locations

Danger description

As the day progresses as a consequence of warming during the day and solar radiation there will be a significant increase in the danger of wet avalanches. An increasing number of medium-sized and, in isolated cases, large wet avalanches are to be expected. This applies in particular on sunny slopes below approximately 3000 m, as well as on north facing slopes below approximately 2400 m. Backcountry tours, off-piste skiing and ascents to alpine cabins should be started early and concluded timely. In particular on steep grassy slopes more large gliding avalanches are possible. Gliding avalanches can be released at any time of day or night. Areas with glide cracks are to be avoided.

region B

Moderate (2=) Dry avalanches, whole day

No distinct avalanche problem

Avalanche prone locations

Danger description

A clear night will be followed in the early morning by quite favourable avalanche conditions generally. Dry avalanches can in particular be released in near-surface layers of the snowpack. Somewhat older wind slabs are in some cases still prone to triggering. In some cases the dry avalanches are medium-sized. Backcountry touring and other off-piste activities call for careful route selection.

Considerable (3) Wet-snow avalanches, as the day progresses

Wet snow, Gliding snow

Avalanche prone locations

Danger description

As the day progresses as a consequence of warming during the day and solar radiation there will be a significant increase in the danger of wet avalanches. An increasing number of medium-sized and, in isolated cases, large wet avalanches are to be expected. This applies in particular on sunny slopes below approximately 3000 m, as well as on north facing slopes below approximately 2400 m. Backcountry tours, off-piste skiing and ascents to alpine cabins should be started early and concluded timely. In particular on steep grassy slopes more large gliding avalanches are possible. Gliding avalanches can be released at any time of day or night. Areas with glide cracks are to be avoided.

region C

Low (1) Dry avalanches, whole day

No distinct avalanche problem
A clear night will be followed in the early morning by favourable avalanche conditions generally.
Individual avalanche prone locations for dry avalanches are to be found in particular in extremely steep terrain. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

Considerable (3) Wet-snow avalanches, as the day progresses

Wet snow, Gliding snow

Avalanche prone locations

Danger description

As the day progresses as a consequence of warming during the day and solar radiation there will be a significant increase in the danger of wet avalanches. An increasing number of medium-sized and, in isolated cases, large wet avalanches are to be expected. This applies in particular on sunny slopes below approximately 3000 m, as well as on north facing slopes below approximately 2400 m. Backcountry tours, off-piste skiing and ascents to alpine cabins should be started early and concluded timely.
In particular on steep grassy slopes more large gliding avalanches are possible. Gliding avalanches can be released at any time of day or night. Areas with glide cracks are to be avoided.

region D

Moderate (2-) Dry avalanches, whole day

No distinct avalanche problem

Avalanche prone locations

Danger description

A clear night will be followed in the early morning by quite favourable avalanche conditions generally. Dry avalanches can in particular be released in near-surface layers of the snowpack. Avalanches are rather small.

Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

Considerable (3) Wet-snow avalanches, as the day progresses

Wet snow, Gliding snow

Avalanche prone locations

Danger description

As the day progresses as a consequence of warming during the day and solar radiation there will be a significant increase in the danger of wet avalanches. An increasing number of medium-sized and, in isolated cases, large wet avalanches are to be expected. This applies in particular on sunny slopes below approximately 3000 m, as well as on north facing slopes below approximately 2400 m. Backcountry tours, off-piste skiing and ascents to alpine cabins should be started early and concluded timely.

In particular on steep grassy slopes more large gliding avalanches are possible. Gliding avalanches can be released at any time of day or night. Areas with glide cracks are to be avoided.

region E

Low (1) Dry avalanches, whole day

No distinct avalanche problem

A clear night will be followed in the early morning by favourable avalanche conditions generally.

Individual avalanche prone locations for dry avalanches are to be found in particular in extremely steep terrain. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

Low (1) Wet-snow avalanches, whole day

Gliding snow

In particular on steep grassy slopes individual gliding avalanches are possible. These can in some cases reach medium size.

Areas with glide cracks are to be avoided as far as possible.

region F

Low (1) Wet-snow avalanches, whole day

Gliding snow
In particular on steep grassy slopes individual gliding avalanches are possible. These can in some cases reach medium size.
Areas with glide cracks are to be avoided as far as possible.

Snowpack and weather
