

Avalanche danger

updated on 8.12.2024, 17:00

region A

Considerable (3-)

Wind slab, Persistent weak layers

Avalanche prone locations

Danger description

The older wind slabs are in some cases still prone to triggering. As a consequence of a moderate to strong bise wind, further wind slabs will form. Single winter sport participants can release avalanches. Mostly these are medium-sized. Additionally avalanches can also be triggered in deep layers and reach large size. This applies in particular on steep north and east facing slopes.
Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger.

region B

Considerable (3-)

New snow, Persistent weak layers

Avalanche prone locations

Danger description

The new snow and wind slabs are in some cases still prone to triggering. Single winter sport participants can release avalanches. Mostly avalanches are medium-sized. Additionally avalanches can also be triggered in deep layers and reach large size. This applies in particular on steep north and east facing slopes. Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger.

region C

Moderate (2+)

Wind slab

Avalanche prone locations

Danger description

The older wind slabs are in some cases still prone to triggering. As a consequence of a moderate to strong bise wind, further wind slabs will form. Single winter sport participants can release avalanches in some places. Mostly these are medium-sized. Backcountry touring and other off-piste activities call for careful route selection.

region D

Moderate (2+)

Wind slab, Persistent weak layers

Avalanche prone locations

Danger description

The fresh and older wind slabs are in some cases prone to triggering. Single winter sport participants can release avalanches. Mostly these are medium-sized. Additionally avalanches can also be triggered in deep layers and reach large size. This applies in particular on steep north and east facing slopes. Backcountry touring and other off-piste activities call for careful route selection.

region E

Moderate (2=)

Wind slab, Persistent weak layers

Avalanche prone locations

Danger description

The more recent wind slabs are in some cases prone to triggering. Single winter sport participants can release avalanches. Additionally avalanches can also be triggered in deep layers and reach medium size in isolated cases. This applies in particular on steep north and east facing slopes. Backcountry touring and other off-piste activities call for meticulous route selection.

region F

Low (1)

Wind slab

Thus far only a little snow is lying. As a consequence of a sometimes strong northerly wind, mostly small wind slabs formed on Sunday in particular at elevated altitudes. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls. At elevated altitudes the avalanche prone locations are a little more prevalent. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

region G

Low (1)

Wind slab

Thus far only a little snow is lying. As a consequence of new snow and wind from variable directions, mostly small wind slabs formed in particular adjacent to ridgelines and in pass areas. Even a small avalanche can sweep people along and give rise to falls.

Snowpack and weather
