

Avalanche danger
updated on 10.12.2025, 17:00

region A Moderate (2+)

Persistent weak layers

Avalanche prone locations

Danger description

Avalanches can be released in the weakly bonded old snow by a single winter sport participant. These can in isolated cases penetrate deep layers and reach dangerously large size. The avalanche prone locations are to be found in areas where the snow cover is rather shallow and at transitions into gullies and bowls. Whumpfung sounds can indicate the danger. Defensive route selection is appropriate.

Low (1)

Wet snow, Gliding snow

Avalanche prone locations

Danger description

The snowpack will be moist below approximately 2400 m. Individual wet avalanches are possible as the day progresses, even medium-sized ones. In addition individual small to medium-sized gliding avalanches are possible. Caution is to be exercised in areas with glide cracks.

region B

Moderate (2=)

Persistent weak layers

Avalanche prone locations

Danger description

Avalanches can be released in the weakly bonded old snow by a single winter sport participant. Mostly avalanches are medium-sized. The avalanche prone locations are to be found in areas where the snow cover is rather shallow and at transitions into gullies and bowls. Backcountry touring and other off-piste activities call for careful route selection.

Low (1)

Wet snow, Gliding snow

Avalanche prone locations

Danger description

The snowpack will be moist below approximately 2400 m. Individual wet avalanches are possible as the day progresses, even medium-sized ones. In addition individual small to medium-sized gliding avalanches are possible. Caution is to be exercised in areas with glide cracks.

region C

Moderate (2=)

Persistent weak layers

Avalanche prone locations

Danger description

Avalanches can be released in the weakly bonded old snow by a single winter sport participant. Mostly avalanches are medium-sized. The avalanche prone locations are to be found in areas where the snow cover is rather shallow and at transitions into gullies and bowls. Backcountry touring and other off-piste activities call for careful route selection.

region D

Moderate (2-)

Persistent weak layers

Avalanche prone locations

Danger description

The wind slabs of the last few days are lying on the unfavourable surface of an old snowpack in particular on steep shady slopes. Single winter sport participants can release avalanches in some places. Caution is to be exercised in particular at transitions from a shallow to a deep snowpack, when entering gullies and bowls for example.

Low (1)

Wet snow, Gliding snow

Avalanche prone locations

Danger description

The snowpack will be moist below approximately 2400 m. Individual wet avalanches are possible as the day progresses, even medium-sized ones. In addition individual small to medium-sized gliding avalanches are possible. Caution is to be exercised in areas with glide cracks.

region E

Moderate (2-)

Persistent weak layers

Avalanche prone locations

Danger description

Only a little snow is lying. Avalanches can in isolated cases be released in the old snowpack and reach medium size. This applies in particular on steep shady slopes. Careful route selection is recommended.

region F

Low (1)

No distinct avalanche problem

Avalanche prone locations

Danger description

Only a little snow is lying. Individual avalanche prone locations for dry avalanches are to be found in extremely steep terrain. Even a small avalanche can sweep people along and give rise to falls.

region G

Low (1)

Wet snow, Gliding snow

Avalanche prone locations

Danger description

The snowpack will be moist below approximately 2400 m. Individual wet avalanches are possible as the day progresses, even medium-sized ones. In addition individual small to medium-sized gliding avalanches are possible. Caution is to be exercised in areas with glide cracks.

Snowpack and weather

updated on 10.12.2025, 17:00

Snowpack

In many places, the fresh and drifted snow layers from last weekend and Monday are lying on weakly bonded old snow. Weak layers in the snowpack are located in particular on northern and sometimes on eastern slopes above around 2400 m. On the northern flank of the Alps, they are sometimes directly beneath the new and drifted snow layers and sometimes also in the middle of the snowpack. In inneralpine regions and in northern Grisons, they are sometimes also in the lower part of the snowpack.

The snowpack has been moistened by rain below 2400 m and is saturated up to around 2100 m. Isolated wet snow avalanches are possible with the sunshine and rising temperatures during the daytime. Isolated gliding avalanches are still possible.

Weather review for Wednesday

After a clear night, conditions were sunny in the mountains during the day.

Fresh snow

-

Temperature

At midday at 2000 m, around +4°C in the south and up to +6°C in the north

Wind

Light to moderate from southwesterly directions

Weather forecast to Thursday

The night will be partly cloudy. During the day it will be partly cloudy, becoming very sunny as the day progresses, especially in the inneralpine regions and in the south.

Fresh snow

-

Temperature

At midday at 2000 m, around +3°C

Wind

Mainly light

Outlook

Skies will clear overnight to Friday and conditions will be sunny on Friday and Saturday. It will remain mild and winds will be mostly light.

The danger of dry avalanches will slowly decrease. Each day, the danger of wet avalanches will vary, becoming somewhat higher as the day progresses. Isolated gliding avalanches will be possible on steep grassy slopes.
