

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →

on Friday 21 11 2025

Wind slab

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **medium**

Wind slabs require caution.

The wind slabs can be released by a single winter sport participant. The avalanche prone locations are to be found in particular on very steep shady slopes and adjacent to ridgelines and in pass areas above approximately 2300 m. As a consequence of the new snow avalanches are possible, but they will be mostly small. In many places there is a danger of falling on the icy crust.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

In some regions up to 15 cm of snow will fall above approximately 600 m. The moderate wind will transport the new snow. In particular adjacent to ridgelines and in pass areas as well as above approximately 2300 m mostly small wind slabs will form. The old snowpack is faceted and weak. The new snow is bonding only slowly with the old snowpack in particular on very steep shady slopes at elevated altitudes.

Tendency

In some localities up to 15 cm of snow will fall above approximately 600 m. Wind slabs require caution.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Friday 21 11 2025

In many places there is a danger of falling on the icy crust. In some regions up to 15 cm of snow will fall above approximately 800 m.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

In some places new snow is lying on an icy crust.

Tendency

In some localities up to 15 cm of snow will fall above approximately 600 m.
