

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Saturday 03 01 2026

Persistent
weak layer

2000m

Weakly bonded old snow above approximately 2000 m.

Weak layers in the old snowpack can be released in isolated cases and mostly by large additional loads at high altitude. Individual small avalanches are not entirely ruled out.

Snowpack

The old snowpack remains generally well bonded. The wind will be strong to storm force over a wide area.
