

Danger Level 1 - Low

Tendency: Constant avalanche danger
on Sunday 14 12 2025

Individual avalanche prone locations are to be found on steep shady slopes at elevated altitudes.

Faceted weak layers exist in the bottom section of the snowpack on shady slopes. The wind slabs are clearly recognisable.

The avalanche prone locations are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain above approximately 2400 m. Avalanches can in some places be released on very steep shady slopes. Mostly the avalanches are small. Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

Snowpack

Less snow than usual is lying in all altitude zones. The snowpack will be subject to considerable local variations.

Faceted weak layers exist in the bottom section of the old snowpack in shady places that are protected from the wind.

Steep sunny slopes: The solar radiation will give rise as the day progresses to increasing moistening of the snowpack.

Tendency

The weather will be mild.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Sunday 14 12 2025

Low avalanche danger will prevail.

Avalanches can in very isolated cases be released, but they will be small in most cases. This applies in particular on very steep shady slopes at elevated altitudes.

Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

Snowpack

Less snow than usual is lying in all altitude zones. The snowpack will be subject to considerable local variations.
