

## Danger Level 2 - Moderate

The fresh and older wind slabs represent the main danger.

As a consequence of the strong to storm force northerly wind, fresh snow drift accumulations will form. This applies especially adjacent to ridgelines and in gullies and bowls. Fresh and older wind slabs are bonding poorly with the old snowpack. The wind slabs of the last few days are prone to triggering in all aspects above approximately 2400 m. The number and size of avalanche prone locations will increase with altitude.

Mostly avalanches are small.

In isolated cases avalanches can be triggered in the weakly bonded old snow. Such avalanche prone locations are to be found in particular on extremely steep shady slopes above approximately 2600 m.

In very isolated cases avalanches are medium-sized.

Even a small avalanche can sweep snow sport participants along and give rise to falls.

## Snowpack

### Danger patterns

dp.6: cold, loose snow and wind

dp.1: deep persistent weak layer

The fresh and older wind slabs are lying on soft layers in particular on shady slopes above approximately 2400 m. In addition further wind slabs will form adjacent to ridgelines and generally in the high Alpine regions.

In particular shady slopes, above approximately 2600 m: Faceted weak layers exist in the bottom section of the snowpack.

The snowpack will be generally subject to considerable local variations.

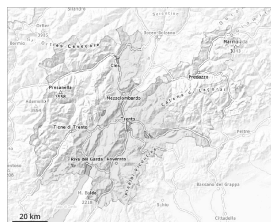

Steep south facing slopes: Only a little snow is lying.

## Tendency

The fresh and older wind slabs represent the main danger.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →

### Wind slabs require caution.

As a consequence of the strong to storm force northerly wind, snow drift accumulations formed on Tuesday. The fresh and older wind slabs can be released in isolated cases in particular on steep shady slopes above approximately 2000 m. This applies in particular adjacent to ridgelines, as well as in gullies and bowls, and behind abrupt changes in the terrain. The prevalence of such avalanche prone locations will increase with altitude.

Mostly avalanches are only small. Even a small avalanche can sweep snow sport participants along and give rise to falls.

### Snowpack

#### Danger patterns

dp.6: cold, loose snow and wind

The fresh and older wind slabs are lying on the unfavourable surface of an old snowpack in particular on wind-protected shady slopes.

The snowpack will be subject to considerable local variations. In all regions a little snow is lying.

### Tendency

Wind slabs represent the main danger.
