

Danger Level 1 - Low

Tendency: Constant avalanche danger
on Sunday 21 12 2025

Wind slab

Individual avalanche prone locations are to be found on shady slopes at elevated altitudes.

The wind slabs of the last few days are in individual cases still prone to triggering in particular on shady slopes above approximately 2600 m. This applies in particular adjacent to ridgelines, as well as in gullies and bowls, and behind abrupt changes in the terrain. Avalanches are small.

In isolated cases avalanches can be triggered in the weakly bonded old snow. Such avalanche prone locations are to be found in particular on extremely steep shady slopes above approximately 2600 m. Mostly avalanches are small.

Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

Snowpack

Shady slopes above approximately 2600 m: The somewhat older wind slabs are lying on soft layers. Faceted weak layers exist in the bottom section of the snowpack.

All aspects below approximately 2600 m: The snowpack is largely stable and its surface has a crust.

The snowpack will be subject to considerable local variations. Less snow than usual is lying in all altitude zones.

Tendency

Low avalanche danger will prevail.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Sunday 21 12 2025

Low avalanche danger will prevail.

Avalanches can scarcely be released. Very isolated avalanche prone locations are to be found on very steep shady slopes at elevated altitudes.

Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

Snowpack

The snowpack will be in most cases stable. Outgoing longwave radiation during the night will be good.

From a snow sport perspective, in most cases insufficient snow is lying.

Tendency

Low avalanche danger will prevail.
