

Avalanche danger
updated on 19.11.2025, 17:00

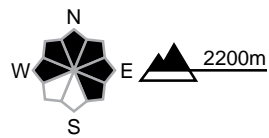

region A

Moderate (2+)

Wind slab, Persistent weak layers

Avalanche prone locations

Danger description

Over a wide area 15 to 25 cm of snow will fall until Thursday. Fresh wind slabs are in some cases prone to triggering. Avalanches can additionally be released in deeper layers in particular on shady slopes, in particular above approximately 2400 m. Avalanches can reach medium size. Careful route selection is required. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

region B

Moderate (2=)

Wind slab, Persistent weak layers

Avalanche prone locations

Danger description

Over a wide area 5 to 15 cm of snow will fall until Thursday. The mostly small wind slabs are in some cases prone to triggering. Avalanches can additionally be released in deeper layers in particular on shady slopes, in particular above approximately 2400 m. Avalanches can reach medium size. Careful route selection is recommended.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

region C

Moderate (2=)

Persistent weak layers

Avalanche prone locations

Danger description

Up to 10 cm of snow will fall. In some localities small wind slabs will form. Especially on steep shady slopes avalanches can be triggered in the weakly bonded old snow and reach medium size in some cases. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

region D

Moderate (2=)

Persistent weak layers

Avalanche prone locations

Danger description

In some localities up to 10 cm of snow will fall. In some localities small wind slabs will form. Especially on steep shady slopes avalanches can be triggered in the weakly bonded old snow and reach medium size in some cases. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

region E

Low (1)

Wind slab

Avalanche prone locations

Danger description

Over a wide area 15 to 25 cm of snow will fall until Thursday. The wind will be moderate at times. Individual avalanche prone locations are to be found in extremely steep terrain. Restraint should be exercised because avalanches can sweep people along and give rise to falls.
The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

region F

Low (1)

No distinct avalanche problem

Avalanche prone locations

Danger description

Over a wide area 5 to 15 cm of snow will fall. Individual avalanche prone locations are to be found in extremely steep terrain. Restraint should be exercised because avalanches can sweep people along and give rise to falls.
The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Snowpack and weather

updated on 19.11.2025, 17:00

Snowpack

After a long spell of fine weather, there was widespread snowfall last weekend. This was deposited on bare ground on southern slopes below approximately 2800 m and on northern slopes below approximately 2000 m. On shady slopes above approximately 2400 m and generally in the high Alpine regions, however, the fresh snow often fell on faceted weak layers. These are still prone to triggering.

In addition, with new fallen snow and weak to moderate westerly winds, mostly small snowdrift accumulations will form that are prone to triggering, especially in the north and at high altitudes.

Outlook

On Friday, except on the southern flank of the Alps, some snow will fall across a wide area down to low altitudes. It will often be cloudy in the south as well. On Saturday, the snowfall will end in the northeast too, but it will remain cloudy there. It will be mostly sunny in the west and south. On both days it will be cold with around -10 °C at 2000 m and moderate northeasterly winds. In total, another 10 to 20 cm of snow will fall in the north from Thursday evening to Saturday morning, and up to 30 cm along the central Prealps. 5 to 15 cm of snow is expected in Lower Valais and Grisons, otherwise less. Avalanche risk will increase somewhat, especially over much of the northern flank of the Alps. There will be little change in other regions. Isolated avalanches may be triggered not only in fresh snowdrift accumulations but also in the old snowpack, especially on northern slopes above 2400 m and in high Alpine regions.
