

Danger Level 2 - Moderate

Tendency: Decreasing avalanche danger
on Friday 12 12 2025

Persistent
weak layer

Weakly bonded old snow requires caution.

In isolated cases avalanches can be triggered in the weakly bonded old snow. Such avalanche prone locations are to be found in particular on very steep northwest, north and northeast facing slopes above approximately 2600 m. Mostly avalanches are small. Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

Only isolated mostly small gliding avalanches are possible. Caution is to be exercised in particular on very steep grassy slopes.

Snowpack

Danger patterns

dp.1: deep persistent weak layer

Shady places that are protected from the wind above approximately 2400 m: Faceted weak layers exist in the bottom section of the snowpack. The somewhat older wind slabs are lying on surface hoar in some places on shady slopes at elevated altitudes. This applies especially in the north.

Very steep sunny slopes below approximately 2400 m: The weather conditions gave rise to significant moistening of the snowpack. Outgoing longwave radiation during the night will be good over a wide area. Early morning: The snowpack is moist and its surface has a crust.

The snowpack will be subject to considerable local variations. From a snow sport perspective, in most cases insufficient snow is lying.

Tendency

Decrease in avalanche danger. The weather will be mild.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Friday 12 12 2025

Low avalanche danger will prevail.

Avalanches can in very isolated cases be released, but they will be small in most cases. This applies in particular on very steep shady slopes at elevated altitudes.

Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

Snowpack

Steep shady slopes: In isolated cases various wind slab layers are lying on a weakly bonded old snowpack.

Very steep sunny slopes: The weather conditions gave rise to significant moistening of the snowpack. Outgoing longwave radiation during the night will be good over a wide area. Early morning: The snowpack is moist and its surface has a crust. Sunshine and high temperatures will give rise as the day progresses to slight softening of the snowpack.

The snowpack will be subject to considerable local variations. From a snow sport perspective, in most cases insufficient snow is lying.

Tendency

The weather will be warm. A little snow is lying.
