

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →
on Wednesday 03 12 2025

Wind slab

The fresh wind slabs are to be evaluated with care and prudence and generally at high altitudes and in high Alpine regions.

The wind slabs of last week must be evaluated with care and prudence in particular on north to east to southeast facing aspects above approximately 2200 m, in particular at transitions from a shallow to a deep snowpack, when entering gullies and bowls for example.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

From a snow sport perspective, in most cases insufficient snow is lying, especially at low and intermediate altitudes.

Snow depths vary greatly at high altitudes and in high Alpine regions, depending on the influence of the wind.

Tendency

Over a wide area light snowfall above approximately 1200 m: The avalanche danger will persist.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Wednesday 03 12 2025

A mostly favourable avalanche situation will prevail.

The snowpack will be generally stable.

Dry avalanches can in very isolated cases be released by people, but they will be small in most cases. Very isolated avalanche prone locations are to be found at intermediate and high altitudes.

The numerous rocks hidden by the recent snow are the main danger.

Snowpack

In all aspects thus far only a little snow is lying in all altitude zones. The snowpack consists of faceted crystals; its surface consists of loosely bonded snow, especially on shady slopes. On sunny slopes the snowpack is frozen but the crust is only thin.

The high humidity gave rise to moistening of the snowpack in some places in particular at low altitude. There is a danger of falling on the icy crust.

Tendency

Over a wide area light snowfall above approximately 1200 m: The avalanche danger will persist.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Wednesday 03 12 2025

The snowpack will be generally stable.

The avalanche prone locations are rather rare. Dry avalanches can in isolated cases be released by people. Very isolated avalanche prone locations are to be found on northeast to east to southeast facing aspects at intermediate and high altitudes. In particular along the border with France more frequent mostly small dry slab avalanches are possible.

The numerous rocks hidden by the recent snow are the main danger.

Snowpack

In all aspects thus far only a little snow is lying in all altitude zones. The snowpack consists of faceted crystals; its surface consists of loosely bonded snow, especially on shady slopes. On sunny slopes the snowpack is frozen but the crust is only thin. The old snowpack is hard.

Tendency

Over a wide area light snowfall above approximately 1200 m: The avalanche danger will persist.
