

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Friday 05 12 2025

Wind slab

Persistent  
weak layer

### Wind slabs represent the main danger.

Adjacent to ridgelines and in pass areas wind slabs formed.

The clearly visible wind slabs represent the main danger. The wind slabs are clearly recognisable to the trained eye. They can be released by a single winter sport participant in some cases above approximately 2000 m. Avalanches can in isolated cases be triggered in the old snowpack and reach medium size.

Whumpfung sounds indicate the danger.

Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

The numerous rocks hidden by the recent snow are the main danger.

### Snowpack

#### Danger patterns

dp.6: cold, loose snow and wind

The snowpack will be generally soft. Towards its base, the snowpack is faceted and weak.

Above the tree line, shady slopes: Over a wide area new snow and wind slabs are lying on a weakly bonded old snowpack.

Over a wide area from a snow sport perspective, in most cases insufficient snow is lying.

### Tendency

In some localities light snowfall to above 1500 m. The avalanche conditions remain to some extent precarious.
