

Avalanche danger

updated on 3.11.2025, 17:00

region A

Considerable (3-)

Wind slab, Persistent weak layers

Avalanche prone locations

Danger description

In some places avalanches can be triggered in the old snow and reach large size in isolated cases. This applies especially on shady slopes above approximately 2800 m. In addition the wind slabs of the last few days are prone to triggering still. Backcountry touring calls for experience in the assessment of avalanche danger. The Avalanche Warning Service currently has only a small amount of information, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Moderate (2)

Wet snow

Avalanche prone locations

Danger description

As a consequence of warming during the day and solar radiation more frequent small to medium-sized gliding avalanches and moist snow slides are possible.

region B

Moderate (2=)

Wind slab, Persistent weak layers

Avalanche prone locations

Danger description

The wind slabs of the last few days represent the main danger. Avalanches can in some places be released by people and reach medium size. Additionally in isolated cases avalanches can also be triggered in deep layers. This applies especially on shady slopes above approximately 2800 m. Backcountry touring calls for careful route selection. The Avalanche Warning Service currently has only a small amount of information, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Moderate (2)

Wet snow

Avalanche prone locations

Danger description

As a consequence of warming during the day and solar radiation more frequent small to medium-sized gliding avalanches and moist snow slides are possible.

region C

Moderate (2=)

Wind slab, Persistent weak layers

Avalanche prone locations

Danger description

The wind slabs of the last few days represent the main danger. Avalanches can in some places be released by people and reach medium size. Additionally in isolated cases avalanches can also be triggered in deep layers. This applies especially on shady slopes above approximately 2800 m. Backcountry touring calls for careful route selection. The Avalanche Warning Service currently has only a small amount of information, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Low (1)

Wet snow

Avalanche prone locations

Danger description

As a consequence of warming during the day and solar radiation moist snow slides are possible.

region D

Moderate (2=)

Wind slab, Persistent weak layers

Avalanche prone locations

Danger description

The wind slabs of the last few days represent the main danger. Avalanches can in some places be released by people and reach medium size. Additionally in isolated cases avalanches can also be triggered in deep layers. This applies especially on shady slopes above approximately 2800 m. Backcountry touring calls for careful route selection. The Avalanche Warning Service currently has only a small amount of information, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Moderate (2)

Wet snow

Avalanche prone locations

Danger description

As a consequence of warming during the day and solar radiation more frequent small to medium-sized gliding avalanches and moist snow slides are possible.

region E

Moderate (2=)

Wind slab, Persistent weak layers

Avalanche prone locations

Danger description

The wind slabs of the last few days represent the main danger. Avalanches can in some places be released by people and reach medium size. Additionally in isolated cases avalanches can also be triggered in deep layers. This applies especially on shady slopes above approximately 2800 m. Backcountry touring calls for careful route selection. The Avalanche Warning Service currently has only a small amount of information, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Low (1)

Wet snow

Avalanche prone locations

Danger description

As a consequence of warming during the day and solar radiation moist snow slides are possible.

region F

Low (1)

No distinct avalanche problem

Avalanche prone locations

Danger description

Individual avalanche prone locations are to be found especially in extremely steep terrain and adjacent to ridgelines and in gullies and bowls. Even a small avalanche can sweep people along and give rise to falls.

Low (1)

Wet snow

Avalanche prone locations

Danger description

As a consequence of warming during the day and solar radiation moist snow slides are possible.

Snowpack and weather

updated on 3.11.2025, 17:00

Snowpack

Sunday's fresh and drifted snow has bonded well with the existing snow surface. Especially in the regions exposed to the most precipitation in southern Grisons, avalanches may in places still be triggered in fresh and drifted snow.

In particular on north-facing slopes above approximately 2800 m and generally in the high Alpine regions, near-ground layers have become faceted. As demonstrated by avalanches that have been triggered, in these regions avalanches can start in the old snowpack and sometimes become large.

As a result of sunshine and warming temperatures during the day, gliding avalanches and loose snow avalanches are to be expected.

Weather review for Monday

Precipitation ended early on Monday morning. Towards the end of the precipitation the snowfall level dropped to 1500 m. During the day, conditions were mostly sunny with some low cumulus clouds.

Fresh snow

From Saturday evening until precipitation stopped on Monday morning, in the north above approximately 2500 m, in the south above approximately 2800 m:

- Avers, Val Bregaglia, Bernina region: 30 to 40 cm
- northern Alpine ridge, Grisons: 15 to 30 cm
- Less elsewhere

Temperature

At midday at 2000 m, around -1 °C in the north and +2 °C in the south

Wind

Strong during the night to Monday in the south and at high altitudes, elsewhere light to moderate northwesterly to northerly

Weather forecast to Tuesday

In the mountains conditions will be mostly sunny and very mild. The zero-degree level will rise to 3600 m.

Fresh snow

-

Temperature

At midday at 2000 m, around +8 °C in the north and +6 °C in the south

Wind

Light

Outlook

Apart from sometimes dense cloud cover, conditions will be mostly sunny in the mountains on Wednesday and Thursday. It will remain very mild. The zero-degree level will be between 3400 m and 3800 m. The southwesterly wind will be light to moderate.

Avalanche risk will decrease.
