

Danger Level 1 - Low

**Tendency: Constant avalanche danger**

on Saturday 24 01 2026

Wind slab

Error: Incomplete joker sentence

The mostly small wind slabs remain in some cases prone to triggering in particular on steep shady slopes and at elevated altitudes. The avalanche prone locations are to be found in particular adjacent to ridgelines and in gullies and bowls and at transitions from a shallow to a deep snowpack. In many places there is a danger of falling on the hard crust. Be careful of the numerous outcropping boulders and rocks covered by little snow.

Snowpack

Over a wide area only a little snow is lying.  
The snowpack will be subject to considerable local variations. Weak layers exist in the old snowpack. They are to be found in particular on shady slopes.

Tendency

Light snowfall.
