

Avalanche danger
updated on 4.11.2025, 17:00

region A

Moderate (2+)

Wind slab, Persistent weak layers

Avalanche prone locations

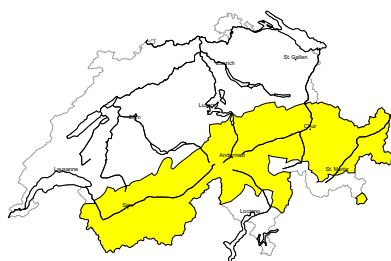

Danger description

In some places avalanches can be triggered in the old snow and reach large size in isolated cases. This applies especially on shady slopes above approximately 2800 m. In addition the wind slabs of Sunday are prone to triggering in some cases still. Backcountry touring calls for careful route selection. The Avalanche Warning Service currently has only a small amount of information, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

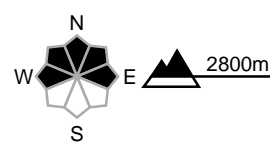

region B

Moderate (2=)

Wind slab, Persistent weak layers

Avalanche prone locations

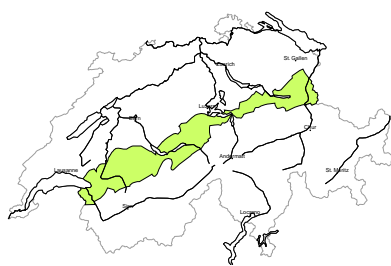

Danger description

In some places avalanches can be triggered in the old snow and reach medium size. This applies especially on shady slopes above approximately 2800 m. In addition the wind slabs of Sunday are prone to triggering in some cases still.

Backcountry touring calls for careful route selection. The Avalanche Warning Service currently has only a small amount of information, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

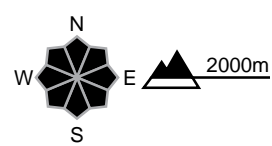

region C

Low (1)

No distinct avalanche problem

Avalanche prone locations

Danger description

Individual avalanche prone locations are to be found especially in extremely steep terrain and adjacent to ridgelines and in gullies and bowls. Even a small avalanche can sweep people along and give rise to falls.

Snowpack and weather

updated on 4.11.2025, 17:00

Snowpack

The snow line on northern slopes is at 1800 m and around 400 m higher on southern slopes. At high altitudes, there are patches of continuous snowpack in gullies and bowls on shady slopes. The snow is significantly deeper above 2800 m. In particular on north-facing slopes above approximately 2800 m and generally in the high Alpine regions, near-ground layers have become faceted. As demonstrated by avalanches triggered on Sunday, in these regions avalanches can start in the old snowpack and sometimes become large.

Outlook

Conditions will be mostly sunny in the mountains on Thursday and Friday. Temperatures will remain very mild with a zero-degree level above 3000 m and the southwesterly wind will be light to moderate. Avalanche risk will decrease.
