

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Saturday 13 12 2025

Wet snow

Wet snow slides and avalanches and gliding avalanches are possible in isolated cases.

As a consequence of warming during the day and solar radiation individual mostly small wet snow slides and avalanches are possible above approximately 1800 m. In addition in all aspects, individual mostly small gliding avalanches are possible.

## Snowpack

### Danger patterns

dp.10: springtime scenario

The snowpack will be subject to considerable local variations below approximately 1800 m. The weather conditions will give rise to increasing and thorough wetting of the snowpack also at high altitude. The surface of the snowpack will only just freeze and will already be soft in the early morning.
