

Avalanche danger
updated on 15.11.2025, 17:00

region A

Considerable (3-)

Wind slab, Persistent weak layers

Avalanche prone locations

Danger description

Up to 30 cm of snow will fall until Sunday above approximately 2400 m. As a consequence of new snow and a sometimes strong southerly wind, avalanche prone wind slabs will form over a wide area. These will be deposited on a weakly bonded old snowpack on shady slopes. Avalanches can over a wide area be released easily and reach medium size. Backcountry touring calls for experience in the assessment of avalanche danger. The Avalanche Warning Service currently has only a small amount of information, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

region B

Moderate (2+)

Wind slab, Persistent weak layers

Avalanche prone locations

Danger description

Up to 20 cm of snow will fall until Sunday above approximately 2400 m. As a consequence of new snow and a sometimes strong southerly wind, avalanche prone wind slabs will form. These will be deposited on a weakly bonded old snowpack on shady slopes. Avalanches can in some places be released easily and reach medium size. Backcountry touring calls for careful route selection. The Avalanche Warning Service currently has only a small amount of information, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

region C

Moderate (2-)

Wind slab

Avalanche prone locations

Danger description

In some regions 10 cm of snow will fall until Sunday above approximately 2400 m. As a consequence of a moderate to strong southwesterly wind, small wind slabs will form in some localities. These are to be evaluated with care and prudence especially in terrain where there is a danger of falling. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

region D

Low (1)

No distinct avalanche problem

Avalanche prone locations

Danger description

Individual avalanche prone locations are to be found in extremely steep terrain. Restraint should be exercised because avalanches can sweep people along and give rise to falls. In high Alpine regions the prevalence of the avalanche prone locations will increase. Here the avalanche danger is a little higher. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Avalanche bulletin through Sunday, 16. November 2025**Snowpack and weather**

updated on 15.11.2025, 17:00

Snowpack

The snow line on northern slopes is around 2000 m, on southern slopes between 2400 m and 2800 m. At high altitudes, there are patches of continuous snowpack in gullies and bowls on shady slopes. The snow depth increases significantly above 2800 m.

The past two weeks have been dry and sunny. While the snow largely melted on steep southern slopes up to high altitudes, the snowpack on shady slopes and in the high alpine regions in general began to facet. Distinct weak layers formed. Avalanches are easily triggered where fresh and drifted snow falls on this snowpack.

Outlook**Monday**

There will be widespread precipitation in the north, falling as snow above 1000 m to 1500 m. 20 to 40 cm of snow will fall at high altitudes. The northwesterly wind will be moderate. In the south, it will be partly sunny with moderate northerly winds. The avalanche danger will increase in the regions exposed to heavier precipitation in the north.

Tuesday

During the night into Tuesday, there will still be a little precipitation above 600 m in the north, with sometimes strong northerly to northeasterly winds. During the day it will be sunny everywhere. The wind will be light to moderate. Avalanche danger will decrease slowly.
