

## Danger Level 3 - Considerable

**Tendency: Constant avalanche danger**  
on Monday 26 01 2026

New snow

Wind slab

Persistent  
weak layer

Fresh and somewhat older wind slabs represent the main danger. Dry slab avalanches are possible. In some regions some new snow to above 800 m.

New snow and wind slabs are lying mostly on old snow containing large grains. Caution is to be exercised on wind-loaded slopes adjacent to ridgelines and in gullies and bowls.

In some cases the avalanches are medium-sized and can be released even by a single winter sport participant.

## Snowpack

### Danger patterns

dp.6: cold, loose snow and wind

dp.1: deep persistent weak layer

The moderate wind will transport the new snow. The avalanche-prone wind slabs are lying on weak layers in particular on wind-protected shady slopes above approximately 2200 m. Avalanches can be released by small loads. The snowpack will be generally subject to considerable local variations.

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger**  
on Monday 26 01 2026

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Monday 26 01 2026

Wind slab

Fresh wind slabs represent the main danger. Faceted weak layers exist in the snowpack especially on shady slopes.

Faceted weak layers exist in the snowpack especially on shady slopes. Mostly the avalanches are small.

## Snowpack

### Danger patterns

dp.1: deep persistent weak layer

Individual avalanche prone locations are to be found in shady places that are protected from the wind.
