

## Danger Level 2 - Moderate

Treeline

**Tendency: Decreasing avalanche danger**  
on Saturday 27 12 2025

Wind slab

Treeline

Persistent  
weak layer

2600m

### Fresh wind slabs represent the main danger.

As a consequence of new snow and a strong wind from easterly directions, wind slabs formed on Wednesday in gullies and bowls and behind abrupt changes in the terrain. These can in some cases be released, even by a single winter sport participant, but they will be small in most cases. Caution is to be exercised in particular on shady slopes above the tree line in the regions exposed to heavier precipitation. Avalanches can in isolated cases penetrate deep layers and reach medium size, especially at elevated altitudes.

In isolated cases avalanches can be triggered in the weakly bonded old snow. Such avalanche prone locations are to be found in particular on extremely steep shady slopes above approximately 2600 m.

### Snowpack

#### Danger patterns

dp.6: cold, loose snow and wind

dp.1: deep persistent weak layer

In some regions up to 15 cm of snow, and even more in some localities, fell on Wednesday. The wind will be moderate. The fresh wind slabs are lying on the unfavourable surface of an old snowpack on wind-protected shady slopes. The old snowpack will be subject to considerable local variations.

### Tendency

The conditions will foster a gradual stabilisation of the snow drift accumulations.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Saturday 27 12 2025

Persistent  
weak layer

### Wind slabs and weakly bonded old snow require caution.

The no longer entirely fresh wind slabs of Wednesday are in some cases prone to triggering in particular on steep shady slopes. Caution is to be exercised adjacent to ridgelines and in gullies and bowls at elevated altitudes.

In isolated cases avalanches can be triggered in the weakly bonded old snow. Such avalanche prone locations are to be found in particular on extremely steep shady slopes above approximately 2600 m. Mostly avalanches are small.

Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

### Snowpack

#### Danger patterns

dp.1: deep persistent weak layer

On Wednesday rather small wind slabs formed in some cases.

Shady slopes above approximately 2600 m: Faceted weak layers exist in the bottom section of the snowpack.

Below approximately 2600 m: The snowpack is largely stable. Hardly any snow is lying on south facing slopes.

The snowpack will be generally subject to considerable local variations. Less snow than usual is lying in all altitude zones.

### Tendency

Low avalanche danger will prevail.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Saturday 27 12 2025

Wind slab

Treeline

### Low avalanche danger will prevail.

Avalanches can in isolated cases be released. The avalanche prone locations are to be found in particular on very steep shady slopes at elevated altitudes. Avalanches are small.

In the Sexten Dolomites, along the border with Austria and along the border with Veneto the avalanche danger is a little higher.

Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

### Snowpack

Some snow fell on Wednesday. In some cases new snow and wind slabs are lying on soft layers. The fresh wind slabs are in isolated cases prone to triggering.

Only a little snow is lying.

### Tendency

Low avalanche danger will prevail.
