## Danger Level 3 - Considerable

**Tendency: Decreasing avalanche danger**  
on Tuesday 04 03 2025

New snow

Wind slab

New snow

1600m

Snowpack stability: poor

Frequency: some

Avalanche size: large

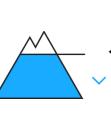

1600m

Snowpack stability: poor

Frequency: some

Avalanche size: large

1600m

Snowpack stability: fair

Frequency: some

Avalanche size: medium

Down to low altitudes snow has fallen over a wide area.  
Considerable avalanche danger will prevail.

Over a wide area over a wide area 20 to 50 cm of snow, and even more in some localities, has fallen. The current avalanche situation calls for experience in the assessment of avalanche danger. The avalanche prone locations are to be found in particular at the base of rock walls and behind abrupt changes in the terrain and adjacent to ridgelines and in gullies and bowls. In particular in the regions exposed to heavier precipitation the avalanches can be released in deep layers of the snowpack. The wind slabs of the last few days are covered with new snow and therefore difficult to recognise.

Avalanches can be released by a single winter sport participant.

As a consequence of solar radiation loose snow avalanches are possible.

### Snowpack

As a consequence of new snow and wind, easily released wind slabs formed.

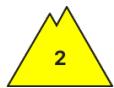

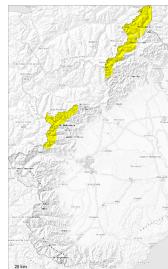

The wind slabs have bonded poorly with the old snowpack. Precarious weak layers exist in the snowpack.

### Tendency

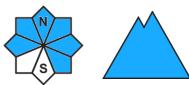

Slight warming.

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger** →  
on Tuesday 04 03 2025

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **medium**

Snowpack stability: **fair**

Frequency: **some**

Avalanche size: **medium**

1800m

The new snow and wind slabs represent the main danger. Moist loose snow avalanches are possible.

As a consequence of snowfall and the occasionally strong wind, fresh snow drift accumulations formed, in particular in gullies and bowls, and behind abrupt changes in the terrain.

Avalanches can be released, even by a single winter sport participant and reach medium size. Medium-sized to large natural avalanches are possible in particular on very steep sunny slopes.

Additionally in some places avalanches can be released in the old snowpack.

### Snowpack

#### Danger patterns

dp.1: deep persistent weak layer

dp.6: cold, loose snow and wind

10 to 20 cm of snow, and even more in some localities, has fallen since Saturday.

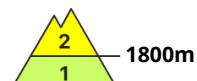

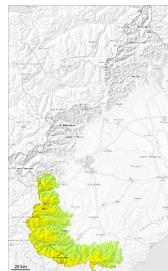

As a consequence of snowfall and the occasionally strong wind, fresh snow drift accumulations formed.

The fresh wind slabs are lying on soft layers in particular on shady slopes above approximately 2000 m.

Towards its base, the snowpack is faceted and weak, in particular on steep east, north and northwest facing slopes,. Sunshine and high temperatures will give rise as the day progresses to increasing moistening of the snowpack in particular on sunny slopes.

## Danger Level 2 - Moderate

Tendency: Constant avalanche danger  
on Tuesday 04 03 2025

Wind slab

1800m

Snowpack stability: fair

Frequency: few

Avalanche size: medium

Wet snow

1800m

Snowpack stability: fair

Frequency: some

Avalanche size: small

The fresh snow and the wind slabs represent the main danger. Moist loose snow avalanches are possible.

As a consequence of snowfall and the occasionally strong easterly wind, fresh snow drift accumulations formed, in particular in gullies and bowls, and behind abrupt changes in the terrain.

The fresh snow and in particular the wind slabs can be released by a single winter sport participant. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls. Watch out for the numerous rocks hidden by the recent snow.

## Snowpack

### Danger patterns

dp.6: cold, loose snow and wind

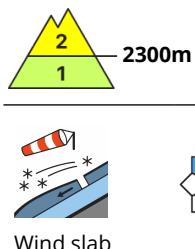

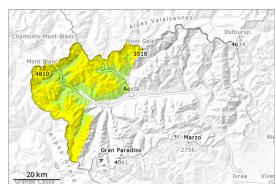

5 to 15 cm of snow has fallen since Saturday above approximately 1500 m. The fresh wind slabs are lying on soft layers in particular on shady slopes above approximately 2000 m.

High altitudes and the high Alpine regions: Snow depths vary greatly, depending on the influence of the wind.

Towards its base, the snowpack is faceted and weak, in particular on steep east, north and northwest facing slopes,. Sunshine and high temperatures will give rise as the day progresses to increasing moistening of the snowpack in particular on sunny slopes.

## Danger Level 2 - Moderate

Tendency: Constant avalanche danger  
on Tuesday 04 03 2025

Snowpack stability: poor  
Frequency: few  
Avalanche size: medium

The snow sport conditions outside marked and open pistes are quite favourable.

The older wind slabs are in individual cases still prone to triggering. They can still be released in some cases, especially on very steep shady slopes in little used backcountry terrain. This applies especially above approximately 2500 m along the border with France and along the border between Valais and Italy. A clear night: Outgoing longwave radiation during the night will be good. The surface of the snowpack will freeze to form a strong crust and will soften during the day. As a consequence of warming during the day and solar radiation mostly small loose snow avalanches are possible.

### Snowpack

The wind was light. This week's fresh and windy snow are gradually settling and stabilising.

Sunny slopes: The surface of the snowpack has frozen to form a strong crust and will soften during the day. In shady places that are protected from the wind: Towards its surface, the snowpack is dry and has a loosely bonded surface.

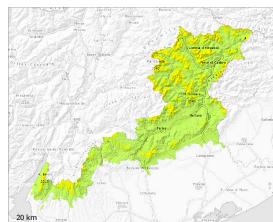

Snow depths vary greatly above approximately 2200 m, depending on the influence of the wind. Adjacent to ridgelines and in pass areas and at high altitude a little snow is lying. At low altitude less snow than usual is lying.

### Tendency

The snow sport conditions outside marked and open pistes are quite favourable.

## Danger Level 2 - Moderate

**Tendency:** Constant avalanche danger  
on Tuesday 04 03 2025

Wind slab

Persistent  
weak layer

Snowpack stability: poor  
Frequency: some  
Avalanche size: medium

Snowpack stability: poor  
Frequency: few  
Avalanche size: medium

Fresh wind slabs require caution. Weak layers in the old snowpack can be released. The danger of moist and wet avalanches will increase during the day. In the event of solar radiation this applies in particular in the Prealps.

The fresh wind slabs can be released by a single winter sport participant and reach large size in isolated cases. Avalanche prone locations are to be found in particular on steep shady slopes above the tree line. Caution is to be exercised in particular adjacent to ridgelines, as well as in gullies and bowls, and behind abrupt changes in the terrain. The avalanche prone locations are sometimes covered with new snow and are difficult to recognise.

Additionally in some places avalanches can release deeper layers of the snowpack. Such avalanche prone locations are to be found on steep west, north and east facing slopes and in little used terrain. In isolated cases avalanches are large. In the regions exposed to heavier precipitation the avalanche prone locations are more prevalent. Whumping sounds can indicate the danger. Caution is to be exercised in particular at transitions from a shallow to a deep snowpack, when entering gullies and bowls for example. Restraint should be exercised because avalanches can sweep people along and give rise to falls.

As a consequence of warming during the day and solar radiation moist loose snow avalanches are to be expected as the day progresses, even medium-sized ones.

## Snowpack

**Danger patterns**

dp.6: cold, loose snow and wind

dp.1: deep persistent weak layer

The fresh wind slabs are lying on soft layers in particular on steep shady slopes.

Faceted weak layers exist in the bottom section of the snowpack on west, north and east facing slopes. Sunshine and high temperatures will give rise as the day progresses to moistening of the snowpack on steep sunny slopes.

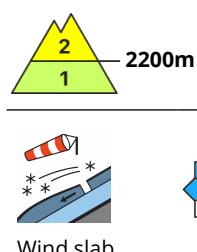

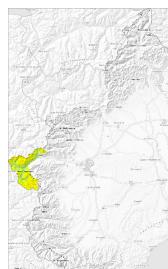

## Tendency

Increase in danger of moist and wet avalanches as a consequence of warming during the day and solar radiation.

## Danger Level 2 - Moderate

Tendency: Constant avalanche danger  
on Tuesday 04 03 2025

Snowpack stability: fair

Frequency: few

Avalanche size: medium

### Fresh wind slabs at high altitudes and in high Alpine regions.

5 to 15 cm of snow has fallen since Saturday. As a consequence of snowfall and the occasionally moderate easterly wind, fresh snow drift accumulations formed. Even single winter sport participants can release avalanches in some places, including medium-sized ones. This applies especially in the regions exposed to precipitation in particular at intermediate and high altitudes, as well as on very steep slopes.

Avalanches can in very isolated cases be released in the old snowpack. This applies in particular in case of a large load. The avalanche prone locations are to be found in particular on shady slopes above approximately 2200 m.

Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

## Snowpack

### Danger patterns

dp.1: deep persistent weak layer

The new snow of yesterday is lying on a crust in all aspects below approximately 2500 m.

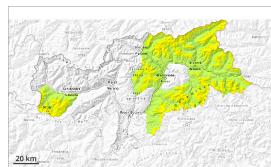

Weak layers exist deeper in the old snowpack especially on steep north, northeast and northwest facing slopes. Towards its base, the snowpack is faceted and weak.

Sunshine and high temperatures will give rise as the day progresses to increasing moistening of the snowpack in particular on sunny slopes.

In particular in the vicinity of peaks snow depths vary greatly, depending on the influence of the wind. In all altitude zones only a small amount of snow is lying for the time of year.

## Danger Level 2 - Moderate

Tendency: Constant avalanche danger  
on Tuesday 04 03 2025 →

Persistent  
weak layer

Snowpack stability: poor  
Frequency: few  
Avalanche size: medium

Avalanches can in isolated cases penetrate deep layers. Wind slabs require caution.

In isolated cases avalanches can be released in the old snowpack and reach medium size. Such avalanche prone locations are to be found on very steep west, north and east facing slopes above approximately 2200 m. Caution is to be exercised in particular at transitions from a shallow to a deep snowpack, when entering gullies and bowls for example.

The older wind slabs can in very isolated cases be released, but they will be small in most cases. Avalanche prone locations are to be found in particular on very steep shady slopes above the tree line. Caution is to be exercised in particular adjacent to ridgelines, as well as in gullies and bowls, and behind abrupt changes in the terrain. The avalanche prone locations are sometimes covered with new snow and are difficult to recognise.

Loose snow avalanches are possible as the day progresses, but they will be mostly small. In particular on steep grassy slopes mostly small gliding avalanches are possible.

## Snowpack

### Danger patterns

dp.1: deep persistent weak layer

Faceted weak layers exist in the bottom section of the snowpack on west, north and east facing slopes.

The fresh snow of the last few days and the mostly small wind slabs to be found in particular adjacent to ridgelines are lying on soft layers on shady slopes.

Outgoing longwave radiation during the night will be good over a wide area. As a consequence of mild temperatures and solar radiation a crust formed on the surface at the weekend. The surface of the snowpack will soften during the day, in particular on steep sunny slopes at intermediate and high altitudes, as well as in all aspects at low altitude.

## Tendency

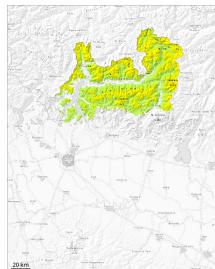

Gradual decrease in danger of dry avalanches. Slight increase in danger of moist and wet avalanches as a

consequence of warming.

## Danger Level 2 - Moderate

Tendency: Constant avalanche danger →  
on Tuesday 04 03 2025

Wind slab

Treeline

Snowpack stability: poor  
Frequency: some  
Avalanche size: medium

Wind slab

Treeline

Snowpack stability: fair  
Frequency: few  
Avalanche size: medium

New snow and wind slabs above approximately 2000 m.

The avalanche prone locations are to be found in particular adjacent to ridgelines above approximately 2000 m and in gullies and bowls, and behind abrupt changes in the terrain. Wind-loaded slopes where weaknesses exist in the old snowpack are unfavourable.

### Snowpack

#### Danger patterns

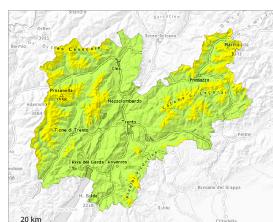

dp.6: cold, loose snow and wind

dp.2: gliding snow

The snowpack will become in some cases unfavourable. In the last few days visible wind slabs formed especially adjacent to ridgelines and in gullies and bowls. Also shady slopes where weaknesses exist in the old snowpack are dangerous. Whumping sounds and the formation of shooting cracks when stepping on the snowpack serve as an alarm indicating the danger.

## Danger Level 2 - Moderate

Tendency: Constant avalanche danger  
on Tuesday 04 03 2025 →

Snowpack stability: poor  
Frequency: few  
Avalanche size: medium

Weak layers deep in the old snowpack necessitate caution. In addition the wind slabs should be taken into account.

Avalanches can be triggered in deep layers and reach medium size. Wind slabs can especially at their margins occasionally be released. Caution is to be exercised in particular adjacent to ridgelines, as well as in gullies and bowls, and behind abrupt changes in the terrain.

As a consequence of warming during the day and solar radiation moist loose snow avalanches are to be expected as the day progresses, but they will be mostly small.

## Snowpack

### Danger patterns

dp.1: deep persistent weak layer

The fresh wind slabs are lying on soft layers in particular on steep shady slopes.

Faceted weak layers exist in the bottom section of the snowpack on west, north and east facing slopes.

The solar radiation will give rise as the day progresses to increasing moistening of the snowpack in particular on sunny slopes.

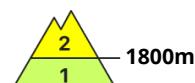

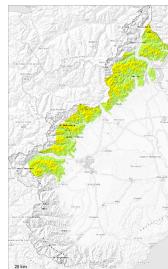

In the last few days above approximately 1800 m several mostly small avalanches occurred naturally.

## Tendency

Increase in danger of moist and wet avalanches as a consequence of warming during the day and solar radiation.

## Danger Level 2 - Moderate

Tendency: Constant avalanche danger

dp.1: deep persistent weak layer

Faceted weak layers exist in the bottom section of the snowpack on west, north and east facing slopes.

The older wind slabs are lying on soft layers in particular on shady slopes.

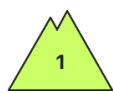

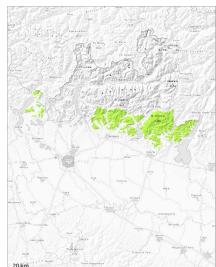

As a consequence of mild temperatures and solar radiation a crust formed on the surface at the weekend. Outgoing longwave radiation during the night will be quite good over a wide area. Steep sunny slopes, high altitudes: The surface of the snowpack will soften during the day.

## Tendency

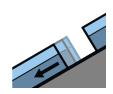

A generally favourable avalanche situation will prevail. Slight increase in danger of moist and wet avalanches as a consequence of warming.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Tuesday 04 03 2025

Gliding snow

Snowpack stability: **fair**  
Frequency: **few**  
Avalanche size: **small**

Gliding avalanches and moist snow slides are possible in isolated cases.

There is a danger of moist snow slides during the day.

## Snowpack

### Danger patterns

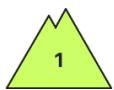

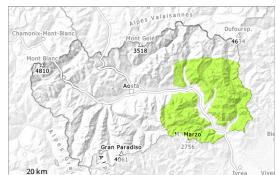

dp.6: cold, loose snow and wind

dp.2: gliding snow

As a consequence of highly fluctuating temperatures and solar radiation the snowpack consolidated during the last few days. In many cases new snow is lying on a moist old snowpack.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Tuesday 04 03 2025

In all aspects only a small amount of snow is lying for the time of year.

Very isolated avalanche prone locations are to be found on extremely steep northwest, north and northeast facing slopes in high Alpine regions. Avalanches can be released in the old snowpack by large loads.

There is a danger of falling on the hard snow surface, in particular on very steep sunny slopes.

### Snowpack

Saturday: Some snow has fallen. The wind was light.

Sunny slopes: The surface of the snowpack has frozen to form a strong crust and will soften during the day.

In shady places that are protected from the wind: Towards its surface, the snowpack is dry and has a loosely bonded surface.

In all aspects only a small amount of snow is lying for the time of year. On sunny slopes below approximately 2600 m hardly any snow is lying.

### Tendency

The avalanche danger will persist.
