

## Danger Level 3 - Considerable

Increase in avalanche danger as a consequence of new snow and wind.

As a consequence of new snow and a moderate to strong wind from northwesterly directions, avalanche prone wind slabs will form above the tree line. The new snow and wind slabs will be deposited on the unfavourable surface of an old snowpack especially on shady slopes. Even single backcountry tourers or freeriders can release avalanches, including medium-sized ones. Remotely triggered avalanches are possible.

As the snowfall level rises wet and gliding avalanches are possible in the afternoon.

Snow sport activities outside marked and open pistes call for experience in the assessment of avalanche danger and caution.

### Snowpack

In some localities 20 to 40 cm of snow, but less in some localities, will fall until Sunday above approximately 2000 m. The sleet will give rise from midday to rapid moistening of the snowpack in all aspects below approximately 2200 m.

Weak layers exist in the centre of the snowpack.

At intermediate and high altitudes snow depths vary greatly, depending on the influence of the wind.

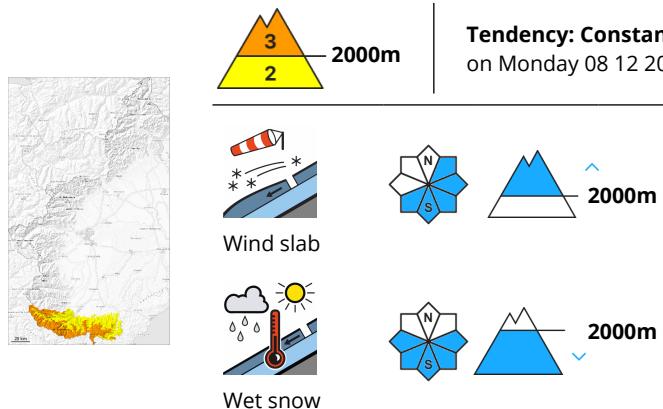

### Tendency

As a consequence of rising temperatures the snow drift accumulations will stabilise during the next few days.

Slight increase in danger of moist snow slides.

## Danger Level 3 - Considerable

Wind slabs and wet snow require caution.

The wind will be moderate to strong. The sometimes large wind slabs of the last few days can be released even by a single winter sport participant in particular on east to south to west facing aspects above approximately 2000 m. This applies in particular on wind-loaded slopes, and at transitions from a shallow to a deep snowpack, when entering gullies and bowls for example. As a consequence of warming during the day and solar radiation more small and medium-sized moist and wet avalanches are possible, in particular in case of releases originating from steep sunny starting zones at low and intermediate altitudes that have retained the snow thus far.

### Snowpack

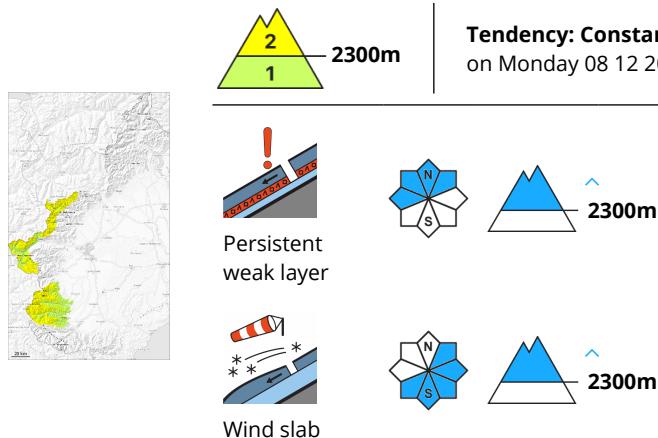

**Danger patterns**

dp.6: cold, loose snow and wind

The moderate wind has transported some snow. The fresh and somewhat older wind slabs are poorly bonded with the old snowpack. Sunshine and high temperatures will give rise as the day progresses to increasing moistening of the snowpack in particular on sunny slopes at low and intermediate altitudes.

## Danger Level 2 - Moderate

Wind slabs and weakly bonded old snow represent the main danger.

Some snow will fall in the regions exposed to the foehn wind. The wind will be moderate to strong. The avalanche prone locations are to be found in particular in steep terrain at high altitudes and in high Alpine regions and adjacent to ridgelines and in gullies and bowls, where The fresh and older wind slabs are lying on weak layers. Mostly the avalanches are medium-sized and can be released even by a single winter sport participant.

The avalanche prone locations are sometimes covered with new snow and are barely recognisable because of the poor visibility.

Below approximately 2200 m from a snow sport perspective, insufficient snow is lying. Watch out for the numerous rocks hidden by the recent snow.

### Snowpack

**Danger patterns**

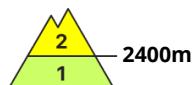

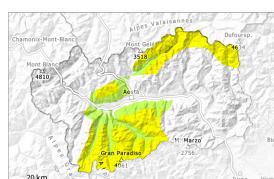

dp.6: cold, loose snow and wind

dp.1: deep persistent weak layer

In particular at low and intermediate altitudes thus far only a little snow is lying. Towards its base, the snowpack consists of faceted crystals, especially on shady slopes. The sometimes moderate wind will transport the fresh and old snow. The fresh and somewhat older wind slabs are poorly bonded with the old snowpack.

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger**  
on Monday 08 12 2025

## Persistent weak layer

## Wind slab

Wind slabs and weakly bonded old snow represent the main danger.

As a consequence of new snow and a moderate to strong wind from northwesterly directions, rather small wind slabs will form in gullies and bowls and behind abrupt changes in the terrain. The fresh and older wind slabs are lying on weak layers.

In isolated cases the avalanches are medium-sized and can be released by a single winter sport participant, caution is to be exercised in particular on very steep shady slopes above approximately 2400 m, and on wind-loaded slopes.

As the snowfall level rises wet and gliding avalanches are possible in the afternoon, but they will be mostly small.

The numerous rocks hidden by the recent snow are the main danger.

## Snowpack

In some localities 5 to 10 cm of snow, and up to 15 cm in some localities, will fall on Sunday above approximately 2000 m. The sleet will give rise from midday to moistening of the snowpack in all aspects below approximately 2100 m.

Weak layers exist in the centre of the snowpack.

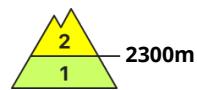

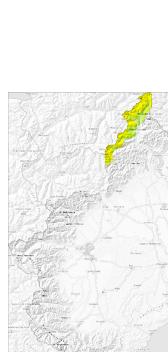

At low and intermediate altitudes from a snow sport perspective, insufficient snow is lying.

## Tendency

Slight increase in danger of moist snow slides as a consequence of warming.

## Danger Level 2 - Moderate

Tendency: Constant avalanche danger  
on Monday 08 12 2025

Persistent  
weak layer

Wind slab

on Monday 08 12 2025

Wind slab

Persistent  
weak layer

Wind slabs represent the main danger. The wind slabs are to be found in particular adjacent to ridgelines and in gullies and bowls and generally at high altitudes.

In some regions up to 5 cm of snow will fall above approximately 1400 m. The sometimes new snow-covered wind slabs can be released by a single winter sport participant in isolated cases on very steep shady slopes. Such avalanche prone locations are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain above approximately 2400 m. Weak layers in the old snowpack represent the main danger.

## Snowpack

### Danger patterns

dp.6: cold, loose snow and wind

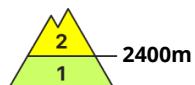

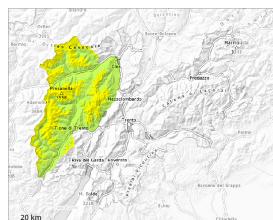

The snowpack remains subject to considerable local variations above approximately 2200 m.

The wind slabs are lying on top of a weakly bonded old snowpack on shady slopes at elevated altitudes. Faceted weak layers exist in the bottom section of the old snowpack in shady places that are protected from the wind.

At low and intermediate altitudes thus far only a little snow is lying. Towards its base, the snowpack consists of faceted crystals, especially on shady slopes.

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger**  
on Monday 08 12 2025 →

Wind slab

2400m

Persistent  
weak layer

2400m

Wind slabs represent the main danger.

The wind slabs must be evaluated with care and prudence especially on very steep west, north and east facing slopes. The avalanche prone locations are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain above approximately 2400 m. Avalanches can in isolated cases reach medium size. Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

In isolated cases avalanches can also be released in near-ground layers, in particular on very steep shady slopes at elevated altitudes.

## Snowpack

### Danger patterns

dp.1: deep persistent weak layer

dp.6: cold, loose snow and wind

The snowpack will be subject to considerable local variations.

The wind slabs are lying on top of a weakly bonded old snowpack on west, north and east facing slopes at elevated altitudes.

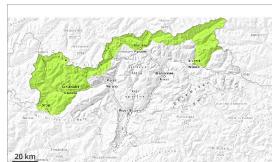

Faceted weak layers exist in the bottom section of the old snowpack in shady places that are protected from the wind.

## Tendency

Monday: The avalanche danger will persist. Until Thursday the weather will be very mild.

## Danger Level 1 - Low

**Tendency: Increasing avalanche danger**  
on Monday 08 12 2025

Wind slab

Individual avalanche prone locations are to be found on very steep shady slopes at elevated altitudes.

The fresh and older wind slabs can be released in isolated cases on very steep shady slopes. Such avalanche prone locations are to be found in gullies and bowls, and behind abrupt changes in the terrain above approximately 2400 m. Avalanches can reach medium size in isolated cases. Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

## Snowpack

### Danger patterns

dp.6: cold, loose snow and wind

dp.1: deep persistent weak layer

Some snow will fall in some regions. As a consequence of a moderate wind from westerly directions, small wind slabs will form.

In some cases various wind slab layers are lying on a weakly bonded old snowpack. This applies in particular on shady slopes at elevated altitudes. They are in isolated cases prone to triggering.

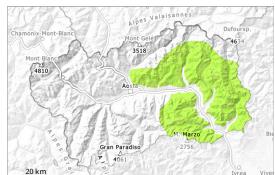

The snowpack will be subject to considerable local variations. From a snow sport perspective, in most cases insufficient snow is lying.

## Tendency

The weather will be mild.

## Danger Level 1 - Low

## **Tendency: Constant avalanche danger**

on Monday 08 12 2025

In all altitude zones from a snow sport perspective, in most cases insufficient snow is lying.

The snowpack will be generally stable.

Very isolated avalanche prone locations are to be found at intermediate and high altitudes and on very steep slopes. The avalanches in these locations are small and can be released in isolated cases by a single winter sport participant. Restraint should be exercised because avalanches can sweep people along and give rise to falls.

The numerous rocks hidden by the recent snow are the main danger.

## Snowpack

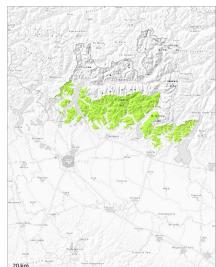

In some localities 2 to 5 cm of snow, but less in some localities, will fall on Sunday above approximately 2000 m. In all altitude zones only a little snow is now lying.

## Tendency

Slight increase in danger of moist snow slides as a consequence of warming.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Monday 08 12 2025

Persistent  
weak layer

1500m

On wind-loaded slopes a low danger of dry avalanches will be encountered in some localities.

In some regions up to 5 cm of snow will fall above approximately 1400 m. The older wind slabs can especially at their margins be released, mostly by large loads, but they will be small in most cases.

## Snowpack

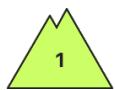

### Danger patterns

dp.1: deep persistent weak layer

From a snow sport perspective, in most cases insufficient snow is lying. Individual avalanche prone locations are to be found at elevated altitudes.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Monday 08 12 2025

Low avalanche danger will prevail.

Avalanches can in very isolated cases be released. This applies especially on very steep shady slopes at elevated altitudes. Avalanches are only small.

### Snowpack

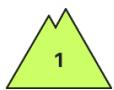

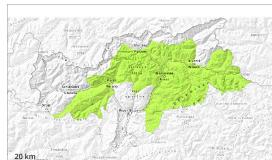

From a snow sport perspective, insufficient snow is lying.

### Tendency

Low avalanche danger will prevail.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Monday 08 12 2025

The avalanche prone locations are rare.

The wind slabs can be released in isolated cases in particular on extremely steep shady slopes at elevated altitudes. This applies in gullies and bowls. Such avalanche prone locations are rare. Avalanches are small.

Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

### Snowpack

The snowpack will be subject to considerable local variations. From a snow sport perspective, in most cases insufficient snow is lying.

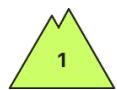

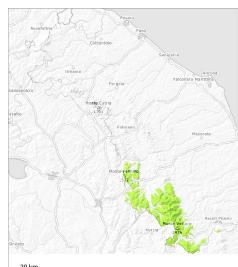

Steep shady slopes: In isolated cases wind slabs are lying on a weakly bonded old snowpack.

### Tendency

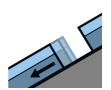

The weather will be mild. A little snow is lying. Low avalanche danger will persist.

## Danger Level 1 - Low

Tendency: Decreasing avalanche danger  
on Monday 08 12 2025

Gliding snow

1800m

Gliding avalanches are possible in isolated cases.

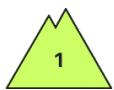

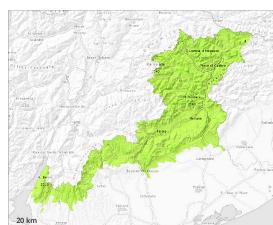

Mostly small gliding avalanches are possible above approximately 1800 m.

## Snowpack

The weather conditions will give rise to increasing moistening of the snowpack below approximately 2000 m. As a consequence of mild temperatures the snowpack will consolidate during the next few days.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Monday 08 12 2025

Wind slab

Persistent  
weak layer

Wind slabs represent the main danger.

Adjacent to ridgelines and in pass areas wind slabs formed.

The clearly visible wind slabs represent the main danger. The wind slabs are clearly recognisable to the trained eye. They can be released by a single winter sport participant in some cases above approximately 2000 m. Avalanches can in isolated cases be triggered in the old snowpack and reach medium size.

Whumping sounds indicate the danger.

Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

The numerous rocks hidden by the recent snow are the main danger.

## Snowpack

### Danger patterns

dp.6: cold, loose snow and wind

The snowpack will be generally soft. Towards its base, the snowpack is faceted and weak.

Above the tree line, shady slopes: Over a wide area new snow and wind slabs are lying on a weakly bonded old snowpack.

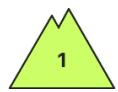

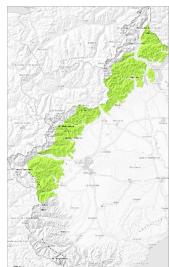

Over a wide area from a snow sport perspective, in most cases insufficient snow is lying.

## Tendency

In some localities light snowfall to above 1500 m. The avalanche conditions remain to some extent precarious.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Monday 08 12 2025

In these regions only a little snow is lying.

In all altitude zones from a snow sport perspective, in most cases insufficient snow is lying.

Watch out for the numerous rocks hidden by the recent snow.

### Snowpack

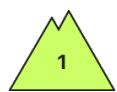

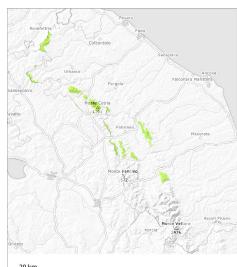

In all aspects thus far only a little snow is lying in all altitude zones.

### Tendency

The avalanche danger will persist.

## Danger Level 1 - Low

Tendency: Decreasing avalanche danger  
on Monday 08 12 2025

Wet snow

1500m

### Moist and wet avalanches.

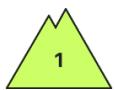

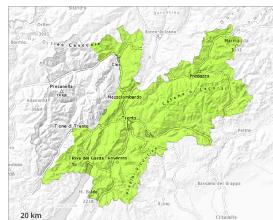

On steep slopes small moist and wet avalanches are possible as a consequence of warming.

### Snowpack

As a consequence of mild temperatures the snowpack will consolidate during the next few days.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger**

on Monday 08 12 2025

Wind slabs represent the main danger.

The wind slabs can be released in isolated cases in particular on very steep shady slopes. Individual avalanche prone locations are to be found in gullies and bowls, and behind abrupt changes in the terrain. Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

### Snowpack

Wind slabs are lying on top of a weakly bonded old snowpack especially on steep shady slopes.

The snowpack will be subject to considerable local variations. In addition, from a snow sport perspective, insufficient snow is lying.

### Tendency

Monday: The avalanche danger will persist. Until Thursday the weather will be very mild.
