

Danger Level 3 - Considerable

2300m

Tendency: Constant avalanche danger
on Monday 08 12 2025 →

Persistent
weak layer

Wind slab

Treeline

Increase in avalanche danger as a consequence of new snow and wind.

As a consequence of new snow and a moderate to strong wind from northwesterly directions, avalanche prone wind slabs will form above the tree line. The new snow and wind slabs will be deposited on the unfavourable surface of an old snowpack especially on shady slopes. Even single backcountry tourers or freeriders can release avalanches, including medium-sized ones. Remotely triggered avalanches are possible.

As the snowfall level rises wet and gliding avalanches are possible in the afternoon.

Snow sport activities outside marked and open pistes call for experience in the assessment of avalanche danger and caution.

Snowpack

In some localities 20 to 40 cm of snow, but less in some localities, will fall until Sunday above approximately 2000 m. The sleet will give rise from midday to rapid moistening of the snowpack in all aspects below approximately 2200 m.

Weak layers exist in the centre of the snowpack.

At intermediate and high altitudes snow depths vary greatly, depending on the influence of the wind.

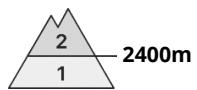

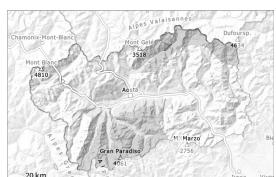

Tendency

As a consequence of rising temperatures the snow drift accumulations will stabilise during the next few days.

Slight increase in danger of moist snow slides.

Danger Level 2 - Moderate

Tendency: Constant avalanche danger
on Monday 08 12 2025

Persistent weak layer

Wind slab

Wind slabs and weakly bonded old snow represent the main danger.

As a consequence of new snow and a moderate to strong wind from northwesterly directions, rather small wind slabs will form in gullies and bowls and behind abrupt changes in the terrain. The fresh and older wind slabs are lying on weak layers.

In isolated cases the avalanches are medium-sized and can be released by a single winter sport participant, caution is to be exercised in particular on very steep shady slopes above approximately 2400 m, and on wind-loaded slopes.

As the snowfall level rises wet and gliding avalanches are possible in the afternoon, but they will be mostly small.

The numerous rocks hidden by the recent snow are the main danger.

Snowpack

In some localities 5 to 10 cm of snow, and up to 15 cm in some localities, will fall on Sunday above approximately 2000 m. The sleet will give rise from midday to moistening of the snowpack in all aspects below approximately 2100 m.

Weak layers exist in the centre of the snowpack.

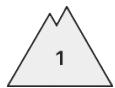

At low and intermediate altitudes from a snow sport perspective, insufficient snow is lying.

Tendency

Slight increase in danger of moist snow slides as a consequence of warming.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Monday 08 12 2025

In all altitude zones from a snow sport perspective, in most cases insufficient snow is lying.

The snowpack will be generally stable.

Very isolated avalanche prone locations are to be found at intermediate and high altitudes and on very steep slopes. The avalanches in these locations are small and can be released in isolated cases by a single winter sport participant. Restraint should be exercised because avalanches can sweep people along and give rise to falls.

The numerous rocks hidden by the recent snow are the main danger.

Snowpack

In some localities 2 to 5 cm of snow, but less in some localities, will fall on Sunday above approximately 2000 m. In all altitude zones only a little snow is now lying.

Tendency

Slight increase in danger of moist snow slides as a consequence of warming.
