

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →
on Saturday 06 12 2025

The wind slabs have formed in particular adjacent to ridgelines and in gullies and bowls and generally at high altitudes. Here dry slab avalanches are possible, even medium-sized ones.

The somewhat older wind slabs can be released by a single winter sport participant in isolated cases on very steep shady slopes. Such avalanche prone locations are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain above approximately 2400 m. Weak layers in the old snowpack represent the main danger.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

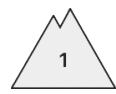

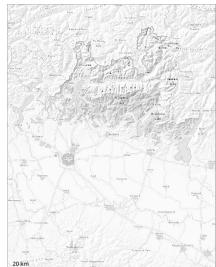

Little snow will fall until the early morning in some regions. The snowpack remains subject to considerable local variations.

Somewhat older wind slabs are lying on top of a weakly bonded old snowpack on shady slopes at elevated altitudes.

Faceted weak layers exist in the bottom section of the old snowpack in shady places that are protected from the wind.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Saturday 06 12 2025

Persistent
weak layer

On wind-loaded slopes a low danger of dry avalanches will be encountered in some localities.

Wind slabs can especially at their margins be released, mostly by large loads, but they will be small in most cases.

Snowpack

Danger patterns

dp.1: deep persistent weak layer

From a snow sport perspective, in most cases insufficient snow is lying. Individual avalanche prone locations are to be found at elevated altitudes.
