

Danger Level 2 - Moderate

Tendency: Constant avalanche danger
on Monday 24 11 2025 →

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **medium**

Small and medium sized dry avalanches are possible in isolated cases.

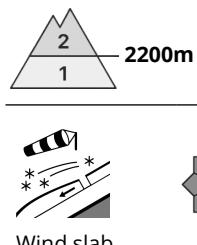

In very isolated cases the dry avalanches are medium-sized. In particular, however, the wind slabs should be taken into account.

Snowpack

As a consequence of snowfall and the occasionally moderate northeasterly wind, fresh snow drift accumulations formed on Saturday.

Danger Level 2 - Moderate

Tendency: Constant avalanche danger
on Monday 24 11 2025 →

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **medium**

Wind slabs represent the main danger.

The wind slabs can be released by a single winter sport participant. Avalanche prone locations are to be found in particular on very steep shady slopes and adjacent to ridgelines and in pass areas above approximately 2200 m.

As a consequence of the new snow moist loose snow avalanches are possible, but they will be mostly small. This applies on very steep sunny slopes, and in steep rocky terrain.

In many places there is a danger of falling on the icy crust.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

The moderate wind has transported some snow. In particular adjacent to ridgelines and in pass areas as well as above approximately 2200 m mostly small wind slabs formed.

The old snowpack is faceted and weak. The new snow is bonding only slowly with the old snowpack in particular on very steep shady slopes at elevated altitudes.

In all regions from a snow sport perspective, in most cases insufficient snow is lying.

Tendency

Up to 5 cm of snow will fall in all altitude zones.

Danger Level 1 - Low

Tendency: Constant avalanche danger →

Wind slab

Snowpack stability: **poor**
Frequency: **few**
Avalanche size: **small**

Wind slabs require caution. This applies on extremely steep slopes in the vicinity of peaks.

The small quantity of fresh snow of the last three days and in particular isolated mostly small wind slabs must be evaluated with care and prudence on extremely steep shady slopes at elevated altitudes. As a consequence of the new snow individual loose snow avalanches are possible, but they will be mostly small. In many places there is a danger of falling on the icy crust. In all regions from a snow sport perspective, insufficient snow is lying.

Snowpack

Danger patterns

(dp.6: cold, loose snow and wind)

The fresh wind slabs have formed adjacent to ridgelines. In some places new snow is lying on an icy crust. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Tendency

Up to 5 cm of snow will fall above approximately 1100 m.

Danger Level 1 - Low

Snowpack stability: **very poor**Frequency: **few**Avalanche size: **small**

Small avalanches and dry loose snow avalanches are possible in isolated cases.

Mostly the dry avalanches are small.

Snowpack

As a consequence of snowfall and the occasionally moderate northeasterly wind, fresh snow drift accumulations formed.
