

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Sunday 04 01 2026

Persistent
weak layer

2000m

Weakly bonded old snow above approximately 2000 m.

Weak layers in the old snowpack can be released in isolated cases and mostly by large additional loads at high altitude. Individual small avalanches are not entirely ruled out.

Snowpack

Between approximately 1500 and 1800 m a little snow is lying. The old snowpack remains favourable at high altitude.
