

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger**  
on Friday 16 01 2026 →

Wind slabs are to be evaluated critically.

The somewhat older wind slabs can be released by a single winter sport participant. The avalanche prone locations are to be found in particular on west to north to east facing aspects above approximately 2000 m. Individual avalanche prone locations are to be found also on steep south facing slopes above approximately 2400 m. Caution is to be exercised in particular at the base of rock walls and behind abrupt changes in the terrain, as well as in gullies and bowls.

In particular in shady places that are protected from the wind avalanches can release the weakly bonded old snow as well and reach quite a large size. Whumping sounds and the formation of shooting cracks when stepping on the snowpack can indicate the danger.

Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

## Snowpack

**Danger patterns**

dp.6: cold, loose snow and wind

dp.5: snowfall after a long period of cold

The wind slabs have settled a little. They are bonding only slowly with the old snowpack. The old snowpack consists of faceted crystals.

Steep south facing slopes: As a consequence of mild temperatures and solar radiation a crust formed on the surface.

The snowpack will be generally subject to considerable local variations. Only a small amount of snow is lying for the time of year in all altitude zones.

## Tendency

Wind slabs are to be avoided.

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger**  
on Friday 16 01 2026 →

Wind slabs are to be avoided.

The somewhat older wind slabs can be released by a single winter sport participant in some cases. The avalanche prone locations are to be found in particular on west to north to east facing aspects above approximately 2000 m and adjacent to ridgelines and in gullies and bowls. Such avalanche prone locations are clearly recognisable to the trained eye. In isolated cases avalanches are medium-sized.

Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

## Snowpack

### Danger patterns

(dp.6: cold, loose snow and wind)

The wind slabs have settled a little. They are bonding only slowly with the old snowpack. The old snowpack consists of faceted crystals.

Steep south facing slopes: As a consequence of mild temperatures and solar radiation a crust formed on the surface.

The snowpack will be generally subject to considerable local variations. Only a small amount of snow is lying for the time of year in all altitude zones.

## Tendency

Individual avalanche prone locations are to be found in particular in steep terrain at elevated altitudes.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Friday 16 01 2026

A little snow is lying. Wind slabs require caution.

The somewhat older wind slabs can be released by a single winter sport participant in isolated cases especially on very steep shady slopes above approximately 2200 m.

Caution is to be exercised in gullies and bowls, and behind abrupt changes in the terrain. Mostly avalanches are only small.

Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

### Snowpack

#### Danger patterns

(dp.6: cold, loose snow and wind)

The wind slabs are lying on unfavourable layers at elevated altitudes.

The old snowpack consists of faceted crystals. The snowpack will be generally subject to considerable local variations. A little snow is lying in all altitude zones.

### Tendency

Low avalanche danger will prevail.
