

Danger Level 2 - Moderate

Tendency: Constant avalanche danger
on Saturday 22.11.2025

Snowpack stability: poor

Frequency: few

Avalanche size: medium

Wind slabs require caution.

The wind slabs can be released by a single winter sport participant. The avalanche prone locations are to be found in particular on very steep shady slopes and adjacent to ridgelines and in pass areas above approximately 2300 m. As a consequence of the new snow avalanches are possible, but they will be mostly small. In many places there is a danger of falling on the icy crust.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

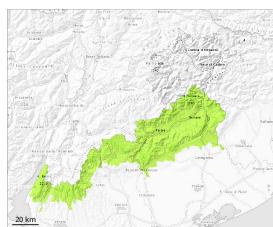

In some regions 5 to 20 cm of snow will fall above approximately 1500 m. In some regions 2 to 10 cm of snow has fallen above approximately 1000 m. The moderate wind has transported some snow. In particular adjacent to ridgelines and in pass areas as well as above approximately 2300 m mostly small wind slabs formed. The old snowpack is faceted and weak. The new snow is bonding only slowly with the old snowpack in particular on very steep shady slopes at elevated altitudes. In all regions from a snow sport perspective, in most cases insufficient snow is lying.

Tendency

Wind slabs require caution.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Saturday 22 11 2025

Snowpack stability: **poor**

Frequency: **few**

Avalanche size: **small**

Wind slabs require caution. This applies on extremely steep slopes in the vicinity of peaks.

As a consequence of new snow and a moderate wind, small wind slabs will form adjacent to ridgelines. As a consequence of the new snow loose snow avalanches are possible, but they will be mostly small. In many places there is a danger of falling on the icy crust. In all regions from a snow sport perspective, insufficient snow is lying.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

Over a wide area 5 to 25 cm of snow will fall above approximately 1000 m. In some localities up to 10 cm of snow has fallen above approximately 1000 m. The fresh wind slabs will form adjacent to ridgelines. In some places new snow is lying on an icy crust.
