

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger** →  
on Wednesday 31 12 2025

Persistent  
weak layer

Wind slab

Weakly bonded old snow especially in shady places that are protected from the wind. Small and medium sized avalanches are possible.

In many cases relatively hard layers of snow are lying on old snow containing large grains. Precarious weak layers exist in the snowpack on wind-protected shady slopes.

In isolated cases the avalanches are medium-sized and can be released in some cases even by a single winter sport participant.

## Snowpack

### Danger patterns

dp.1: deep persistent weak layer

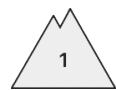

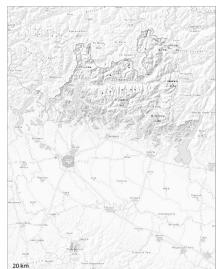

dp.6: cold, loose snow and wind

Some fresh snow and the mostly small wind slabs are poorly bonded with the old snowpack in particular on steep north, northeast and northwest facing slopes above approximately 2400 m.

Faceted weak layers exist in the bottom section of the old snowpack in shady places that are protected from the wind. At low and intermediate altitudes from a snow sport perspective, insufficient snow is lying.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Wednesday 31 12 2025

Persistent  
weak layer

1700m

Weakly bonded old snow represents the main danger.

Avalanche prone weak layers exist in the snowpack especially on shady slopes. In isolated cases the avalanches are small.

## Snowpack

### Danger patterns

dp.1: deep persistent weak layer

Individual avalanche prone locations are to be found in shady places that are protected from the wind. From a snow sport perspective, in most cases insufficient snow is lying.
