## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Tuesday 16 12 2025

Wet snow

In gullies and bowls a low avalanche danger will be encountered in some localities.

Wind slabs can at their margins occasionally be released by large loads, but they will be small in most cases.

## Snowpack

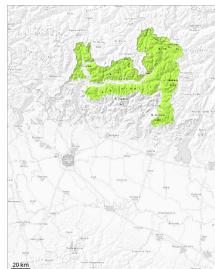

### Danger patterns

dp.1: deep persistent weak layer

From a snow sport perspective, in most cases insufficient snow is lying. Individual avalanche prone locations are to be found in shady places that are protected from the wind.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger**  
on Tuesday 16 12 2025

Wind slab

2400m

Wet snow

Wind slabs represent the main danger. The wind slabs are to be found in particular adjacent to ridgelines and in gullies and bowls and generally at high altitudes.

The wind slabs are mostly easy to recognise but can be released by large loads at their margins in particular. Weak layers in the old snowpack represent the main danger.

In very isolated cases the avalanches are rather small and can mostly only be released by large loads, caution is to be exercised in particular on very steep shady slopes above approximately 2400 m on wind-loaded slopes.

## Snowpack

### Danger patterns

dp.6: cold, loose snow and wind

The snowpack remains subject to considerable local variations above approximately 2200 m.

The wind slabs are lying on top of a weakly bonded old snowpack on shady slopes at elevated altitudes. Faceted weak layers exist in the bottom section of the old snowpack in shady places that are protected from the wind.

At low and intermediate altitudes thus far only a little snow is lying.
