

Danger Level 3 - Considerable

Wind slabs and wet snow require caution.

The wind will be moderate to strong. The sometimes large wind slabs of the last few days can be released even by a single winter sport participant in particular on east to south to west facing aspects above approximately 2000 m. This applies in particular on wind-loaded slopes, and at transitions from a shallow to a deep snowpack, when entering gullies and bowls for example. As a consequence of warming during the day and solar radiation more small and medium-sized moist and wet avalanches are possible, in particular in case of releases originating from steep sunny starting zones at low and intermediate altitudes that have retained the snow thus far.

Snowpack

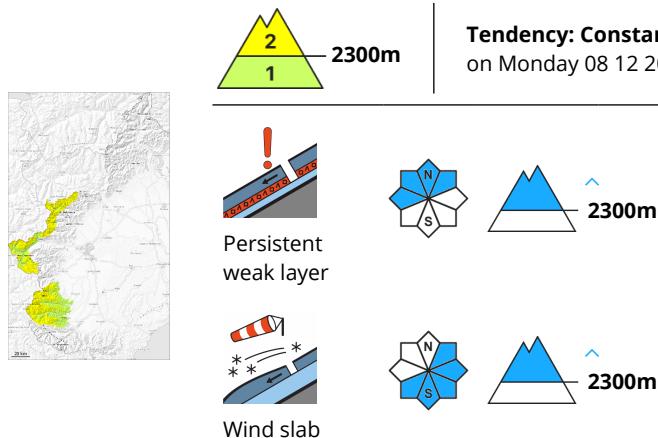

Danger patterns

dp.6: cold, loose snow and wind

The moderate wind has transported some snow. The fresh and somewhat older wind slabs are poorly bonded with the old snowpack. Sunshine and high temperatures will give rise as the day progresses to increasing moistening of the snowpack in particular on sunny slopes at low and intermediate altitudes.

Danger Level 2 - Moderate

Tendency: Constant avalanche danger
on Monday 08 12 2025 →

Wind slabs and weakly bonded old snow represent the main danger.

Some snow will fall in the regions exposed to the foehn wind. The wind will be moderate to strong. The avalanche prone locations are to be found in particular in steep terrain at high altitudes and in high Alpine regions and adjacent to ridgelines and in gullies and bowls, where The fresh and older wind slabs are lying on weak layers. Mostly the avalanches are medium-sized and can be released even by a single winter sport participant.

The avalanche prone locations are sometimes covered with new snow and are barely recognisable because of the poor visibility.

Below approximately 2200 m from a snow sport perspective, insufficient snow is lying. Watch out for the numerous rocks hidden by the recent snow.

Snowpack

Danger patterns

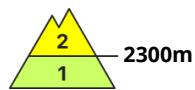

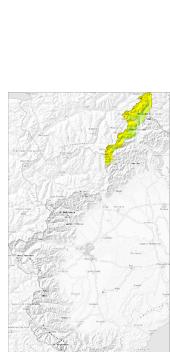

dp.6: cold, loose snow and wind

dp.1: deep persistent weak layer

In particular at low and intermediate altitudes thus far only a little snow is lying. Towards its base, the snowpack consists of faceted crystals, especially on shady slopes. The sometimes moderate wind will transport the fresh and old snow. The fresh and somewhat older wind slabs are poorly bonded with the old snowpack.

Danger Level 2 - Moderate

Tendency: Constant avalanche danger

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Monday 08 12 2025

In these regions only a little snow is lying.

In all altitude zones from a snow sport perspective, in most cases insufficient snow is lying.

Watch out for the numerous rocks hidden by the recent snow.

Snowpack

In all aspects thus far only a little snow is lying in all altitude zones.

Tendency

The avalanche danger will persist.
