

Danger Level 2 - Moderate

Tendency: Constant avalanche danger
on Thursday 01 01 2026 →

Fresh wind slabs require caution.

Sometimes avalanche prone wind slabs will form. These can be released in particular on steep shady slopes above approximately 2200 m. Caution is to be exercised adjacent to ridgelines and in gullies and bowls. The number and size of avalanche prone locations will increase with altitude.

Avalanches can additionally be released in the weakly bonded old snow in very isolated cases. Such avalanche prone locations are to be found in particular on extremely steep shady slopes above approximately 2600 m.

Mostly avalanches are small.

Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

The wind will be strong to storm force. As a consequence of low temperatures and the occasionally storm force northwesterly wind, the snow drift accumulations will increase in size. The fresh and older wind slabs are lying on soft layers in particular on shady slopes at elevated altitudes.

Shady slopes above approximately 2600 m: Faceted weak layers exist in the bottom section of the snowpack.

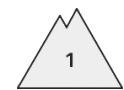

The snowpack will be generally subject to considerable local variations. A little snow is lying in all altitude zones. Steep south facing slopes: Hardly any snow is lying.

Tendency

The wind slabs remain prone to triggering. They represent the main danger.

Danger Level 1 - Low

Tendency: Constant avalanche danger →

Fresh wind slabs require caution.

The fresh and older wind slabs can be released in isolated cases in particular on steep shady slopes above approximately 2000 m. This applies in particular adjacent to ridgelines. Avalanches are small.

Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

The fresh wind slabs are lying on the unfavourable surface of an old snowpack in particular on wind-protected shady slopes.

The snowpack will be subject to considerable local variations. A little snow is lying in all altitude zones. Hardly any snow is lying on south facing slopes.

Tendency

Low avalanche danger will prevail.
