

**AM****PM**

## Danger Level 3 - Considerable

**AM:**

**PM:**

Locally increased avalanche danger in the upper reaches of valleys bordering Piedmont.

At high altitude the avalanche prone locations are more prevalent. The avalanche danger will increase during the day.

The new snow of the last few days is lying on the unfavourable surface of an old snowpack in particular on steep shady slopes.

As a consequence of snowfall and the moderate wind, the snow drift accumulations will increase in size in the afternoon.

Mostly the avalanches are shallow but can be released in some cases even by a single winter sport participant, especially on very steep slopes.

Several small and medium-sized natural avalanches are possible as a consequence of new snow and strong wind.

### Snowpack

20 to 30 cm of snow, and even more in some localities, has fallen since Saturday above approximately 2000 m. Wednesday: 10 to 15 cm of snow will fall in the afternoon above approximately 1400 m.

Large-grained weak layers exist in the old snowpack on shady slopes. In all altitude zones a little snow is

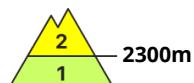

lying on south facing slopes. At intermediate and high altitudes snow depths vary greatly, depending on the influence of the wind. The numerous rocks hidden by the recent snow are the main danger.

## Tendency

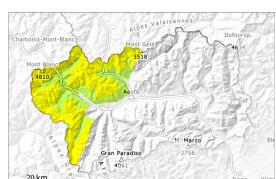

In some localities up to 15 cm of snow will fall on Thursday. The fresh snow and the deep wind slabs can be released easily.

## Danger Level 2 - Moderate

Tendency: Constant avalanche danger  
on Thursday 25 12 2025 →

The avalanche prone locations are to be found in particular on steep shady slopes above approximately 2300 m.

Mostly the avalanches are shallow but can be released in some cases by a single winter sport participant.

This applies in particular adjacent to ridgelines and in gullies and bowls on very steep slopes.

The avalanches can be triggered in the faceted old snow and reach medium size in isolated cases.

Afternoon: Several mostly small avalanches are possible as the snowfall level drops.

## Snowpack

5 to 10 cm of snow has fallen since Saturday above approximately 2200 m. Wednesday: 2 to 5 cm of snow will fall in the afternoon above approximately 1400 m.

Weak layers exist in the old snowpack on shady slopes.

The weather conditions gave rise to moistening of the snowpack especially at low altitude.

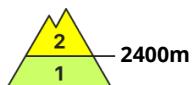

The new snow of the last few days is lying on surface hoar in some places. At intermediate and high altitudes snow depths vary greatly, depending on the influence of the wind. The numerous rocks hidden by the recent snow are the main danger.

## Tendency

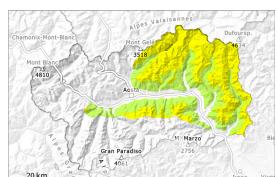

5 cm of snow will fall on Thursday. The small quantity of fresh snow and the small wind slabs represent the main danger.

## Danger Level 2 - Moderate

Tendency: Increasing avalanche danger  
on Thursday 25 12 2025

Persistent  
weak layer

The avalanche prone locations are to be found in particular on very steep shady slopes above approximately 2400 m.

The fresh and older wind slabs are lying on the unfavourable surface of an old snowpack in particular on very steep shady slopes. At high altitude the avalanche prone locations are more prevalent. Single winter sport participants can release avalanches in some places. In some places the avalanches can be triggered in the faceted old snow, in particular on very steep slopes.

Several mostly small snow slides and avalanches are possible as a consequence of the new snow.

### Snowpack

5 to 15 cm of snow has fallen since Saturday above approximately 2000 m. Wednesday: 5 to 10 cm of snow, but less in some localities, will fall from the afternoon above approximately 1400 m.

The weather conditions gave rise to gradual moistening of the snowpack in some cases especially at low and intermediate altitudes. Large-grained weak layers exist in the old snowpack on shady slopes. The new snow of the last few days is lying on surface hoar in some places. In all altitude zones a little snow is lying on south facing slopes. At intermediate and high altitudes snow depths vary greatly, depending on the influence of the wind. The numerous rocks hidden by the recent snow are the main danger.

### Tendency

In some localities up to 10 cm of snow will fall on Thursday. The fresh snow and the mostly small wind slabs must be evaluated with care and prudence.
